In order to use the IO axis bus, first decide whether the IO axis bus is to be used for transferring controller errors in the network ("release cord" principle) or as a pure open-collector IO function. The required function of the IO axis bus must then be set for all nodes in [C02440/1](#).

- "Master/slave" function ("release cord" principle)
  - In this setting, the IO axis bus only knows the two statuses "OK" and "Error".
  - Each node connected to the IO axis bus can set the IO axis bus into the "Error" status.
  - In the "Error" status, all nodes start their adjustable response, e.g. a synchronised braking of the drive system or the master only brakes the network to standstill.
  - The "Error" status can only be reset by the node defined as "master".
  - The internal time base of the inverters can be synchronised via the IO axis bus.
- "IO" function
  - With this setting, the IO axis bus is used as a pure IO transmission medium.
  - Each node connected to the IO axis bus can transmit a TRUE signal to all nodes.

**Short overview of the relevant parameters:**

| Parameters               | Info  | Lenze setting |      |
|--------------------------|---|---------------|------|
|                          |   | Value         | Unit |
| <a href="#">C00591/2</a> | Resp. to axis bus IO error <ul style="list-style-type: none"> <li>• <a href="#">From version 12.00.00</a></li> </ul>  | 1: Fault      |      |
| <a href="#">C01120</a>   | Sync signal source  | 0: Off        |      |
| <a href="#">C02440/1</a> | Axis bus IO function  | 0: Off        |      |
| <a href="#">C02444/1</a> | Axis bus settings (bit coded) <ul style="list-style-type: none"> <li>• <a href="#">From version 12.00.00</a></li> <li>• Bit 0 serves to reconfigure the <a href="#">LS AxisBusIO.bSetFail_DigOut</a> input from level-sensitive to edge-sensitive.</li> </ul> | 0x0000        |      |

### 14.3.1 "Master/slave" function

With this setting, the IO axis bus can be used as "release cord", i.e. each node can set all other nodes into an error status.

One IO axis bus node takes over the master role. The master's task is to output a synchronisation cycle to the IO axis bus to which the slaves can orient themselves:

[14-4] IO axis bus: Synchronisation cycle from the master (error-free status)

The inverter is configured as master or slave in [C02440/1](#) or by selecting "1: Master" or "2: Slave".

#### Synchronisation of the internal time base

The internal time base of the slaves can be synchronised via the IO axis bus. The slaves orient themselves to the synchronisation cycle output by the master:

[14-5] Synchronisation cycle

- In order that the IO axis bus is used as synchronisation source, all slaves must be set to "AxisBusIO" in [C01120](#).
- The internal time base is synchronised based on the HIGH edge in a 2-ms cycle (see illustration above).
- Internal timing and trimming of the phase position are set automatically.
- Basically, only one source is allowed to synchronise the internal time base. If "AxisBusIO" is selected, this is the IO axis bus master.

More information on this subject can be found in the following main chapter ["Synchronisation of the internal time base"](#). (📖 912)

#### Error-free status

In the error-free status, all nodes are error-active, i.e. each node can set the IO axis bus into the "Error" status.

### Error status

By setting the [LS AxisBusIO.bSetFail\\_DigOut](#) input to TRUE, each node can set the IO axis bus into the "Error" status. The node signals this by reducing the HIGH pulse length to 620 µs:

[14-6] Synchronisation cycle (error status)

All other nodes detect the "error status" due to the changed pulse length which has the following effect:

- The [LS AxisBusIO.bFail\\_DigIn](#) output is set to TRUE. This digital signal can be used for any application within the function block interconnection.
- From version 12.00.00:
  - The error response set in [C00591/2](#) is activated (Lenze setting: "Fault").
  - The error message "[Ab02: Axis bus IO error](#)" is entered into the logbook.
- The nodes are now error-passive, i.e. they cannot signalise any further errors in order that the HIGH edge for synchronisation can be detected after 2 ms.

### Reset "error" status

#### Note!

The "error" status can only be reset by the master!

A FALSE/TRUE edge at the [LS AxisBusIO.bResetFail](#) input (for the master) serves to reset the "error" status again. The master signals this by providing a LOW pulse for 3 ms.

All other nodes detect the error reset due to this signal, which has the following effect:

- The [LS AxisBusIO.bFail\\_DigIn](#) output is reset to FALSE.
- After a delay time of 2 ms, the [LS AxisBusIO.bResetFailIn](#) output is set for 3 ms to TRUE. This digital signal can be used within the function block interconnection to e.g. reset errors.

### Application notes

In the event of an error in a network, a slave drive should never trigger the "Fault error response as this causes the pulse inhibit. This deactivates the coupling to the master and hence the network.

#### Possible solution:

1. Reconfigure the "Fault" error response to "Warning" in the slave axes.
2. Use the "master/slave" function ("release cord") to report errors and warnings to the master.  
The master can then initiate the respective response for the entire network.

In the following interconnection example, the slave drive uses the *bCollectedFail* group error output of the SB [LS\\_DriveInterface](#) for "pulling the release cord". Non-relevant inputs/outputs of the SB [LS\\_DriveInterface](#) are hidden for an easier presentation.

[14-7] Configuration for "master/slave" function ("release cord")

In order that this mechanism works, the following parameter setting is additionally required for the slave drive:

1. Go to [C00148](#) and set bit 6 to "1" in order that warnings are also provided via the *bCollectedFail* group error output of the SB [LS\\_DriveInterface](#).
2. Go to [C02444/1](#) and set bit 0 to "1" in order that the *bSetFail\_DigOut* input is edge-sensitive instead of level-sensitive. Otherwise, the error set input is "latched" and the slave drive does not respond anymore to an error reset by the master.

### 14.3.2 "IO" function

With this setting, the IO axis bus is used as a pure IO transmission medium, just like it the case for the 9300 and 9400 device series.

The "IO" function is activated in [C02440/1](#) by selecting "3: IO".

#### Note!

- "IO" function and [Data transfer axis bus](#) are mutually exclusive since with activated "IO" function, a synchronisation of the internal time base is not possible (which is required for a "safe" data transfer).
  - The "IO" function must be set for all IO axis bus nodes.
  - Triggering an error message with this function is only possible by function block interconnection.
  - Resetting an error message is not possible with this function.
- 
- By setting the [LS\\_AxisBusIO.bSetFail\\_DigOut](#) input to TRUE, the IO axis bus is set to the dominant level and for all nodes, the [LS\\_AxisBusIO.bFail\\_DigIn](#) output is set to TRUE.
  - The [LS\\_AxisBusIO.bResetFail](#) input has no function.
  - The [LS\\_AxisBusIO.bResetFail\\_In](#) output is always FALSE.

### 14.3.3 Internal interfaces | System block "LS\_AxisBusIO"

The **LS\_AxisBusIO** system block maps the IO axis bus in the FB Editor:

#### inputs

| Designator      | Data type | Information/possible settings  |  |
|-----------------|-----------|--|--|
| bSetFail_DigOut | BOOL      | Set IO axis bus into the "error" status / IO data exchange                                       |  |
|                 |           | TRUE or FALSE → TRUE   | For all IO axis bus nodes, the <i>bFail_DigIn</i> output is set to TRUE.<br>• From version 12.00.00 onwards, bit 0 in <a href="#">C02444/1</a> can be used to reconfigure the <i>bSetFail_DigOut</i> input from level-sensitive to edge-sensitive. |
| bResetFail      | BOOL      | Reset "error" status<br>• Only possible with "Master/slave" function via the IO axis bus master. |  |
|                 |           | FALSE → TRUE   | For all IO axis bus nodes, the <i>bFail_DigIn</i> output is reset to FALSE.<br>After a delay time of 2 ms, the <i>bResetFail_In</i> output is set to TRUE for 3 ms for error reset.  |

#### outputs

| Designator    | Data type | Value/meaning   |  |
|---------------|-----------|---|--|
| bFail_DigIn   | BOOL      | With "master/slave" function: "Error" status<br>With "IO" function: Data exchange   |  |
|               |           | TRUE  | An IO axis bus nodes has set the <i>bSetFail_Digout</i> input to TRUE.                       |
| bResetFail_In | BOOL      | "Error" status has been reset<br>• With "IO" function, this output is always FALSE. |  |
|               |           | TRUE  | The IO axis bus master has reset the error message.<br>This status is only pending for 3 ms. |

## 15 Synchronisation of the internal time base

In a drive system, synchronising the internal time bases of all inverters involved makes sense because cyclic process data should be processed synchronously in all drives.

- One of the following signal sources can be used for automatic synchronisation of the internal time base of the inverter:
  - CAN bus ("CAN on board") → [sync telegram](#)
  - Axis bus ("AxisBusIO") → [master/slave function](#)
  - MCI → sync signal of a plugged-in communication module (EtherCAT, PROFINET or Powerlink)

### Short overview of the parameters for the synchronisation of the internal time base:

| Parameters                     | Info                             | Lenze setting |      |
|--------------------------------|----------------------------------|---------------|------|
|                                |                                  | Value         | Unit |
| <a href="#">C00370/1</a>       | CAN Sync instant of transmission | -             | µs   |
| <a href="#">C00370/2</a>       | Sync instant of reception        | -             | µs   |
| <a href="#">C01120</a>         | Sync signal source               | Off           |      |
| <a href="#">C01121</a>         | Sync cycle time setpoint         | 1000          | µs   |
| <a href="#">C01122</a>         | Sync phase position              | 0             | µs   |
| <a href="#">C01123</a>         | Sync window                      | 100           | µs   |
| <a href="#">C01124</a>         | Sync correction width            | 320           | ns   |
| Greyed out = display parameter |                                  |               |      |

### Sync signal source

The synchronisation signal source can be selected in [C01120](#). As a general rule, only one source can be used to synchronise the internal time base.

### Sync cycle time setpoint

Time with which the internal phase-locking loop (PLL) expects the synchronisation signals. The time must be set in [C01121](#) in accordance with the cycle of the synchronisation source selected in [C01120](#).

### Note!

- Only integer multiples of 1000 µs can be set in [C01121](#).
- Intelligent communication modules usually define the cycle time setpoint derived from the bus cycle. In this case, a manual change is not possible.
- Even in case of a synchronisation via axis bus, a setting of the cycle time and the phase position is not required/possible and is executed automatically.

Example: For the CAN bus, 2 ms has been selected as interval between two synchronisation signals. If the CAN bus is to be used as synchronisation source, a cycle time setpoint of 2000 µs must be selected in [C01121](#).

### Sync window

In [C01123](#), a time slot can be defined around the expected synchronisation time. The time slot defines the range in which the synchronisation signal is expected.

If "4:MCI" is selected in [C01120](#), the time slot must be set to 100 µs.

### Sync phase position

The phase position determines the zero-time of the internal system cycle with regard to the synchronisation signal (bus cycle). Since PDO processing is an inherent part of the system part of the application, the instant of acceptance of the PDOs is postponed as well by a changed phase position.

- If "0" is set, the internal system cycle starts at the same time as the synchronisation signal.
- If a value  $> 0$  is set, the internal system cycle starts by the set time earlier (the phase position has a negative effect) than the synchronisation signal.
- Intelligent communication modules define the optimal time with activated synchronisation by themselves. In this case, a manual change is not possible.
- For determining [C01122](#), the point in time where all bus nodes have valid PDOs is decisive.

Example: If the phase position is set to  $550\ \mu\text{s}$ , the system part of the application starts  $550\ \mu\text{s}$  before the arrival of the synchronisation signal.

### Sync correction width

If the cycle times of the synchronisation signal and the phase-locking loop (PLL) are different, the setting in [C01124](#) defines the correction increments for the phase-locking loop.

- The recommended reset time for the CAN bus as synchronisation source in case of occurring deviations is  $320\ \text{ns}$  (Lenze setting).
- If synchronisation is not reached, select a higher correction width.
- The optimum setting depends on quartz precision and must be determined empirically if required.

## 15.1

### Internal interfaces | System block "LS\_SyncManagement"

The SB **LS\_SyncManagement** provides status information for synchronising the internal time base:

### outputs

| Designator    | Data type | Value/meaning               |
|---------------|-----------|-----------------------------|
| bSyncSignalOK | BOOL      | TRUE Sync signal OK         |
| bSyncPhaseOK  | BOOL      | TRUE Sync phase position OK |

## 16 Parameter change-over

For up to 32 freely selectable parameters, this basic function provides a change-over between four sets with different parameter values.

The parameter list is created in the same way as the user menu is composed, namely by means of parameterisation. In the »Engineer«, a user-friendly parameterisation dialog with import and export functions is available for this purpose.

### Motor data changeover

From version 12.00.00, an optional changeover between four parameter sets with different motor and control settings is supported in addition.

The optional motor data changeover is provided for applications/machines which have multiple axes controlled successively but which do not require the simultaneous operation of multiple motors. In this case, the very same inverter can control the motors successively. Advantages of this solution: Fewer components ( inverters) and hence less energy consumption.

### Principle:

- The motor which is being controlled at the moment is connected to the inverter via motor contactors. (The contactor system can e.g. be controlled via the digital outputs of the inverter.)
- At the same time, the motor data changeover serves to activate the motor and control settings suitable for the motor in the inverter.

### Note:

The motor data changeover is carried out within 2 ms and hence within the opening and closing times of most motor contactors.

[16-1] Principle of the selective control of multiple motors using one inverter

## 16.1 Configuring parameter change-over via the »Engineer« parameterisation dialog

Proceed as follows to open the dialog for parameterising the parameter change-over:

1. »Engineer« Go to the *Project* view and select the 8400 TopLine inverter.
2. Select the **Application parameters** tab from the *Workspace*.
3. Go to the *Overview* dialog level and click the "Basic functions" button.
4. Go to the *Overview* → *Basic functions* dialog box and click the **Parameter change-over** button.

| Line | Code | Name | Unit | Active value | Value 1 | Value 2 | Value 3 | Value 4 |
|------|------|------|------|--------------|---------|---------|---------|---------|
| 01   |      |      |      |              |         |         |         |         |
| 02   |      |      |      |              |         |         |         |         |
| 03   |      |      |      |              |         |         |         |         |
| 04   |      |      |      |              |         |         |         |         |
| 05   |      |      |      |              |         |         |         |         |
| 06   |      |      |      |              |         |         |         |         |
| 07   |      |      |      |              |         |         |         |         |
| 08   |      |      |      |              |         |         |         |         |
| 09   |      |      |      |              |         |         |         |         |
| 10   |      |      |      |              |         |         |         |         |
| 11   |      |      |      |              |         |         |         |         |

Configure... Import... Export...

### Note!

The "parameter change-over" basic function is always processed, even if the corresponding [LS WriteParamList](#) system block has been removed from the interconnection by the function block editor.

If you do not require this basic function anymore, delete the composed parameter list in order that no unwanted parameter write operations take place.

### 16.1.1 Configuring the parameter list(s)

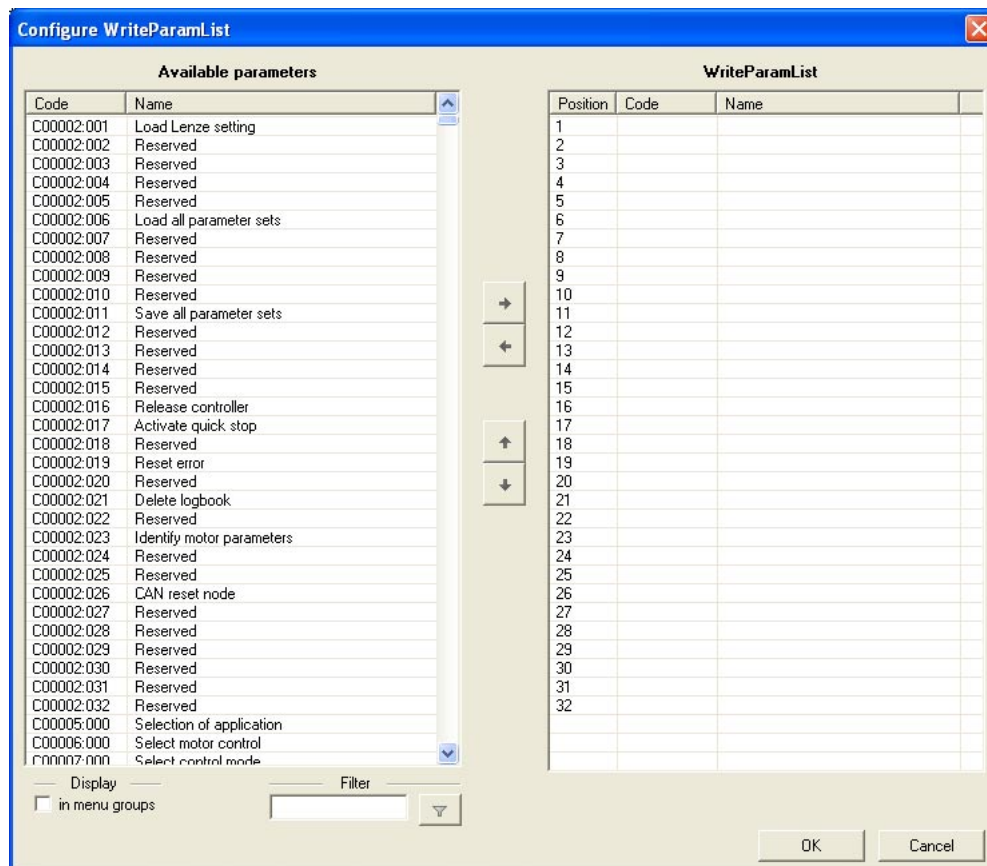

#### Configuring the definable parameter list

In the Lenze setting, the definable parameter list does not yet contain any parameters.

#### How to configure the definable parameter list:

1. Click the **Adapt...** button.
  - The dialog box entitled *Configure WriteParamList* is shown:

- On the left-hand side, all the parameters of the inverter with write and read access are shown in the list entitled **Available parameters**.
  - If the option **In menu groups** is activated, all parameters are shown assigned to their functions.
  - By clicking on the  button in the **Filter** area, you can shorten the list of available parameters. If, for example, you enter the text "ain1" and then click on the button, only those parameters whose designation contains this text are shown for selection.
2. Highlight the parameter/parameters in the **Available parameters** list that is/are to be added to the *WriteParamList*.
    - For a multi-selection you can, just like in the general Windows function, use the <Ctrl> and <Shift> key.

3. Click on the  button in order to add the highlighted parameters to the *WriteParamList* on the right-hand side.
  - With the  and  buttons, you can alter the sequence of parameters in the *WriteParamList*.

To remove parameters from the *WriteParamList*, proceed as follows:

  - Highlight the parameter/parameters in the **WriteParamList** that is/are to be removed from the *WriteParamList*.
  - Click on the  button to remove the highlighted parameters from the *WriteParamList*.
4. Click the **OK** button to accept the configuration and close the dialog box.
  - You can call the configuration dialog again at any time in order to change or expand the *WriteParamList* retrospectively.

### Changing the values of the definable parameter list

After the compilation of the definable parameter list, the values in the columns **1st value ... 4th value** first correspond to the Lenze setting of the respective parameter.

- Just click one of the input fields in these columns to change the displayed value.
- If you place the cursor in an input field, the permitted value range for the corresponding parameter is shown under the table.

### Changing the values of the motor data parameter list

Click the **Motor data parameter list** register to put it in the foreground:

| Definable parameter list |           |                                    |      | Motor data parameter list |         |         |         |         | Copy values |  |
|--------------------------|-----------|------------------------------------|------|---------------------------|---------|---------|---------|---------|-------------|--|
| Line                     | Code      | Name                               | Unit | Active value              | Value 1 | Value 2 | Value 3 | Value 4 |             |  |
| 01                       | C0006:000 | Motor control                      |      | 6                         | 6       | 6       | 6       | 6       |             |  |
| 02                       | C0015:000 | VFC: V/f base frequency            | Hz   | 50                        | 50      | 50      | 50      | 50      |             |  |
| 03                       | C0016:000 | VFC: V/min boost                   | %    | 1,6                       | 1,6     | 1,6     | 1,6     | 1,6     |             |  |
| 04                       | C0018:000 | Switching frequency                |      | 2                         | 2       | 2       | 2       | 2       |             |  |
| 05                       | C0019:000 | Auto-DCB: Threshold                | rpm  | 3                         | 3       | 3       | 3       | 3       |             |  |
| 06                       | C0021:000 | Slip compensation                  | %    | 2,67                      | 2,67    | 2,67    | 2,67    | 2,67    |             |  |
| 07                       | C0022:000 | I <sub>max</sub> in motor mode     | A    | 47                        | 47      | 47      | 47      | 47      |             |  |
| 08                       | C0023:000 | I <sub>max</sub> in generator mode | %    | 100                       | 100     | 100     | 100     | 100     |             |  |

- Unlike the "definable" parameter list, the motor data parameter list has a fixed assignment to the motor and control parameters.
  - A list of the switchable motor and control parameters is provided in chapter "[Configuring the motor data parameter list by means of parameterisation](#)". (📖 922)
- The preset values are changed in the same way as the definable parameter list.

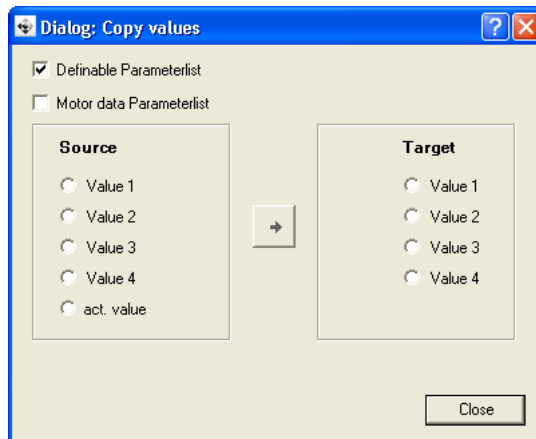

### Copying values

All the settings of a value set can be copied to another value set.

To copy values, proceed as follows:

1. Click on the **Copy values** button.
  - The *Copy values* dialog box is displayed:

2. Define the parameter list to be copied via the two upper checkboxes.
3. Select **Source** and **Target**.
4. Click on  button in order to copy the values from **Source** to **target**.

### Importing/exporting the list

For cross-device reuse of the configured *WriteParamList*, you can click on the **Export** and **Import** buttons to save the parameter selection as an \*.epc file and then to re-import the saved \*.epc file into another 8400 inverter.

### 16.1.2 Configuring control inputs

The three control inputs for parameter change-over can be configured via the following parameters:

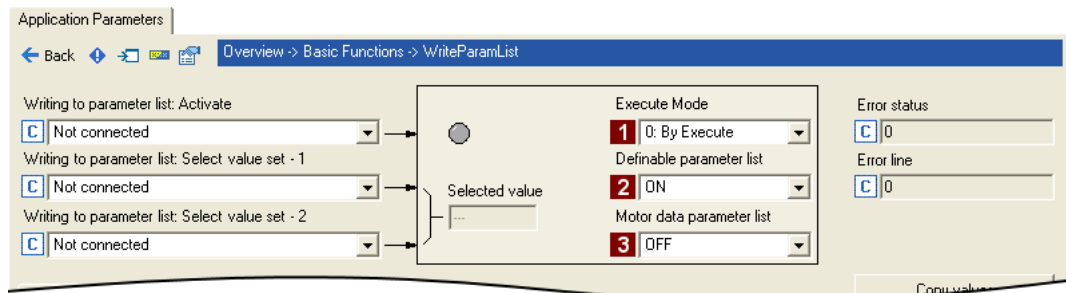

| Parameters  | Lenze setting    | Info  |
|---|------------------|---|
| <b>1</b> <b>Activate writing</b><br>(C00621/123)        | 0: Not connected | Selection of the signal source that activates writing to the parameter list (for <a href="#">Execute Mode</a> = "0: by Execute").   |
| <b>2</b> <b>Selection value set - 1</b><br>(C00621/124) | 0: Not connected | Selection of the two signal sources for the binary-coded selection of the value set 1 ... 4 to be used (see following truth table). |
| <b>3</b> <b>Selection value set - 2</b><br>(C00621/125) | 0: Not connected |   |

Truth table for the selection of the value set to be used:

| Selection value set - 1 | Selection value set - 2 | Value set used |
|-------------------------|-------------------------|----------------|
| FALSE                   | FALSE                   | Value set 1    |
| TRUE                    | FALSE                   | Value set 2    |
| FALSE                   | TRUE                    | Value set 3    |
| TRUE                    | TRUE                    | Value set 4    |

### 16.1.3 Functional settings

| Parameters  | Lenze setting | Info  |
|---|---------------|---|
| <b>1</b> <b>Execute Mode</b><br>(C01082)                | 0: by Execute | For writing the parameter list, two modes are available: <ul style="list-style-type: none"> <li>• 0: by Execute (Lenze setting)<br/>The writing of the parameter list is activated by a FALSE/TRUE edge at the <i>bExecute</i> control input.</li> <li>• 1: by Input Select<br/>The parameter list is written when the selection inputs <i>bSelectWriteValue_1</i> and <i>bSelectWriteValue_2</i> are changed and once during the initialisation of the inverter.</li> </ul> <b>Note:</b> If the execute mode changes from "0: by Execute" to "1: by Input Select", the parameter list selected by the selection inputs is written once. In the execute mode "1: by Input Select", the parameter list then is only written again when a change occurs on the selection inputs . |
| <b>2</b> <b>Definable parameter list</b><br>(C02200/1)  | 1: On         | Switch on/off parameter changeover for the definable parameter list.  |
| <b>3</b> <b>Motor data parameter list</b><br>(C02200/2) | 0: Off        | Switch on/off parameter changeover for the motor data parameter list.   |

### 16.1.4 Error message

With every run through the main program, one parameter of the definable parameter list is written until the parameter list has been executed completely. If an error occurs, [C01083](#) displays an error status and [C01084](#) displays the number of the list entry causing the error (in connection with the selected value set).

Please observe the note regarding the processing time of the main program in section

► [LS\\_ParReadWrite\\_1-6](#) (1811)

- If several errors occur at the same time, only the first incorrect list entry will be displayed. Hence, after elimination of the displayed error and another activation, more errors may be displayed.
- The parameter list will always be processed from beginning to end, even if errors occur in the meantime.

## 16.2 Configuring the definable parameter list by means of parameterisation

The following application example shows the necessary procedure for configuring the list without using the »Engineer« parameterisation dialog.

### Task:

The LS\_WriteParamList SB is to be used to write to parameters [C00012](#), [C00026/1](#) and [C00027/1](#).

### Compiling the parameter list

In [C01085/1 ... n](#), specify the above-named parameters in the <Code>,<Subcode> format:

- [C01085/1](#) = 12.000
- [C01085/2](#) = 26.001
- [C01085/3](#) = 27.001
- [C01085/4 ... n](#) = 0.000 (no parameter)

### Note!

Gaps in the parameter list (setting = 0.000) are permissible and are skipped in the process.

Invalid parameter entries are not accepted when being entered.

### Entering values for the parameters (value set 1)

In [C01086/1 ... n](#), specify the values to be used to describe the selected parameters. The values are entered according to the scaling format/scaling factor of the respective parameter.

- [C01086/1](#) = <value> for list entry 1 (in our example: for parameter [C00012](#))
- [C01086/2](#) = <value> for list entry 2 (in our example: for parameter [C00026/1](#))
- [C01086/3](#) = <value> for list entry 3 (in our example: for parameter [C00027/1](#))

These values are used in the writing process if the two *bSelectWriteValue\_1* and *bSelectWriteValue\_2* inputs are not assigned or both set to FALSE.

### Entering other values for the parameters (value sets 2 ... 4)

If required, up to three other sets can be set in the same way in [C01087/1 ... n](#) to [C01089/1 ... n](#) which can optionally be written to the parameters. The decision as to which value set is finally used is dependent upon the assignment of the two *bSelectWriteValue\_1* and *bSelectWriteValue\_2* inputs:

## 16.3

## Configuring the motor data parameter list by means of parameterisation

The setting of the values for value sets 1 ... 4 of the motor data parameter list can also be carried out directly via the codes from code [C02210](#) (see following table; columns 1st value ... 4th value).

- Unlike the "definable" parameter list, the motor data parameter list has a fixed assignment to the motor and control parameters.
- The preset values for value sets 1 ... 4 correspond to the Lenze setting of the respective motor or control parameter.
- The values are entered according to the scaling format / scaling factor of the respective motor or control parameter.

| Code                     | Name   | Lenze setting | 1st value                | 2nd value                 | 3rd value                 | 4th value                 |
|--------------------------|--|---------------|--------------------------|---------------------------|---------------------------|---------------------------|
| <a href="#">C00006</a>   | Motor control                                | 6             | <a href="#">C02210/1</a> | <a href="#">C02210/2</a>  | <a href="#">C02210/3</a>  | <a href="#">C02210/4</a>  |

## 16.4 Internal interfaces | System block "LS\_WriteParamList"

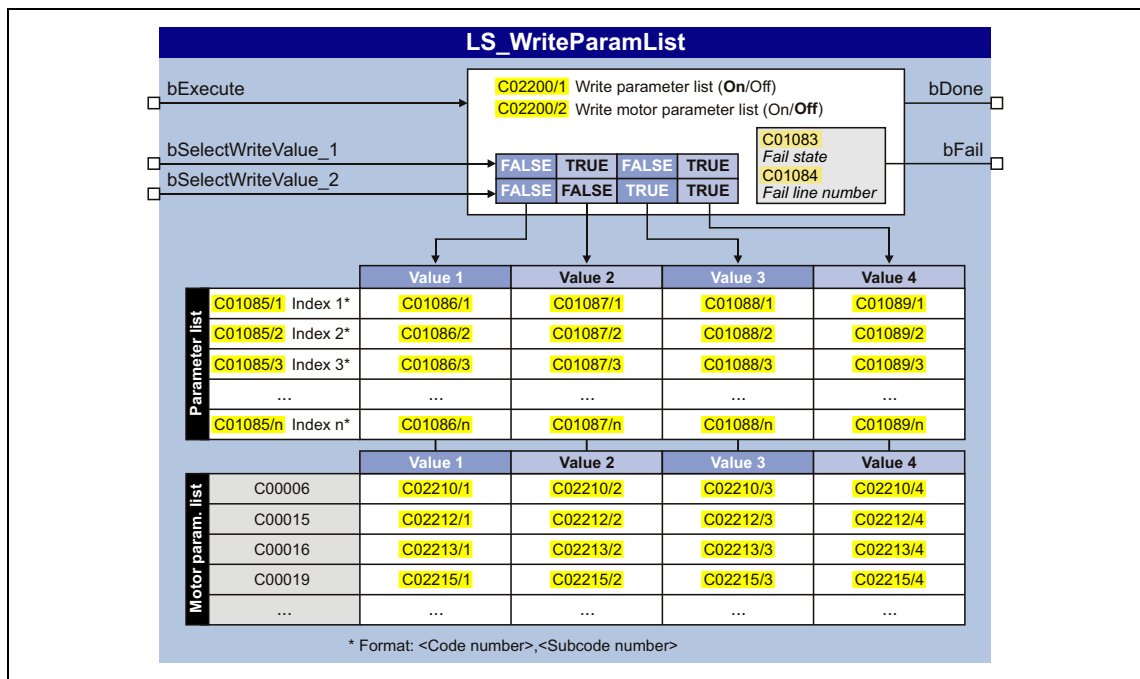

The **LS\_WriteParamList** system block provides the internal interfaces for the basic "Parameter change-over" function.

### Note!

The "parameter change-over" basic function is always processed, even if the **LS\_WriteParamList** system block has been removed from the interconnection by the FB Editor.

If you do not require this basic function anymore, delete the composed parameter list in order that no unwanted parameter write operations take place.

### inputs

| Designator                                 | Data type | Information/possible settings                               |  |             |
|--|-----------|---|--|-------------|
| bExecute                                   | BOOL      | FALSE↗TRUE  | For Execute Mode ( <a href="#">C01082</a> ) = "0: by Execute":<br>Activate writing of the parameter list |             |
| bSelectWriteValue_1<br>bSelectWriteValue_2 | BOOL      | Binary coded selection of the value set 1 ... 4 to be used. |  |             |
|  |           | <i>bSelectWriteValue_1</i>                                  | <i>bSelectWriteValue_2</i>   |             |
|  |           | FALSE   | FALSE  | Value set 1 |
|  |           | TRUE  | FALSE  | Value set 2 |
|  |           | FALSE   | TRUE   | Value set 3 |
|  |           | TRUE  | TRUE   | Value set 4 |

**outputs**

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bDone      | BOOL      | "Writing of the parameter list completed" status signal <ul style="list-style-type: none"> <li>The output is automatically reset to FALSE if writing via <i>bExecute</i> is activated again.</li> </ul>   |
|            |           | TRUE Writing of the parameter list successfully completed.  |
|            |           | FALSE The FALSE status can have the following meanings: <ol style="list-style-type: none"> <li>There is no active writing of the parameter list.</li> <li>Writing of the parameter list has not been completed yet.</li> <li>An error has occurred (if <i>bFail</i> = TRUE).</li> </ol> |
| bFail      | BOOL      | "Error" status  |
|            |           | TRUE An error has occurred (group signal). <ul style="list-style-type: none"> <li>See display parameter <a href="#">(C01083)</a> for details.</li> </ul>  |

### 17 Parameter reference

This chapter describes all parameters which can be used for parameterising and monitoring the inverter.

---

Parameters which are only available in the inverter from a certain software version onwards are marked with a corresponding note in the parameter description ("from version xx.xx.xx").

The parameter descriptions are based on software version V21.00.00

---

#### Tip!

For quick reference of a parameter with a certain name simply use the **index** of the online documentation. The index always contains the corresponding code in parentheses behind the name.

General information on parameter setting can be found in the chapter "[Introduction: Parameterising the inverter](#)". (📖 34)

For general information on how to read and change parameters, please see the online documentation for the »Engineer«.

## 17.1 Structure of the parameter descriptions

Each parameter is described in the [Parameter list](#) in the form of a table which consists of the following three areas:

### Table header

The table header contains the following general information:

- Parameter number (Cxxxxx)
- Parameter name (display text in the »Engineer« and keypad)
- [Data type](#)
- Parameter index in decimal and hexadecimal notation for access via a fieldbus (e.g. CAN system bus).

### Tip!

The parameter index is calculated as follows:

- Index [dec] = 24575 - code
- Index [hex] = 0x5FFF - code

Example for code C00005:

- Index [dec] = 24575 - 5 = 24570
- Index [hex] = 0x5FFF - 0x{5} = 0x5FFA

### Table contents

The table contains further general explanations & notes on the parameter and the possible settings, which are represented in different ways depending on the parameter type:

- [Parameters with read-only access](#)
- [Parameters with write access](#)

### Table footer

The table footer contains the [Parameter attributes](#).

### 17.1.1 Data type

The following data types are available for parameters:

| Data type      | Meaning                                      |
|----------------|--|
| INTEGER_16     | 16-bit value with sign                       |
| INTEGER_32     | 32-bit value with sign                       |
| UNSIGNED_8     | 8-bit value without sign                     |
| UNSIGNED_16    | 16-bit value without sign                    |
| UNSIGNED_32    | 32-bit value without sign                    |
| VISIBLE_STRING | String of characters of printable characters |

### 17.1.2 Parameters with read-only access

Parameters for which the "write access" attribute has not been set can only be read and not be changed by the user.

#### Description structure

|  |  |                                  |
|--|--|----------------------------------|
| Parameter Name: <b>Cxxxxx</b>   _____  |  | Data type: _____<br>Index: _____ |
| Description  |  |                                  |
| <b>Display range</b> (min. value   unit   max. value)  |  |                                  |
|  |  |                                  |
| <input checked="" type="checkbox"/> Read access <input type="checkbox"/> Write access <input type="checkbox"/> CINH <input type="checkbox"/> PLC STOP <input type="checkbox"/> No transfer <input type="checkbox"/> COM <input type="checkbox"/> MOT           Scaling factor: 1 |  |                                  |

#### Representation in the »Engineer«

The »Engineer« displays these parameters with a grey background or, with an online connection, with a pale-yellow background:

|  | C... | S | Name                          | Value      | Unit |
|--|------|---|-------------------------------|------------|------|
|  | 3    | 0 | Status of last device command | Successful |      |

### 17.1.3 Parameters with write access

Only parameters with a check mark (☑) in front of the "write access" attribute can be changed by the user. The Lenze setting for these parameters is **printed in bold**.

- The settings can either be selected from a selection list or the values can be entered directly.
- Values outside the valid setting range are represented in red in the »Engineer«.

#### 17.1.3.1 Parameters with setting range

##### Description structure

|  |  |  |                                  |  |
|--|--|--|----------------------------------|--|
| Parameter   Name:<br>Cxxxxx   _____  |  |  | Data type: _____<br>Index: _____ |  |
| Description  |  |  |                                  |  |
| <b>Setting range (min. value   unit   max. value)</b>                                      |  |  | <b>Lenze setting</b>             |  |
|  |  |  |                                  |  |
| ☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ COM ☐ MOT Scaling factor: 1 |  |  |                                  |  |

##### Parameter setting in the »Engineer«

In the »Engineer«, parameters are set by entering the desired value into the input field:

|    | C... | S | Name                   | Value | Unit |
|----|------|---|------------------------|-------|------|
| 11 | 0    |   | Appl.: Reference speed | 1500  | rpm  |

#### 17.1.3.2 Parameters with selection list

##### Description structure

|  |  |  |                                  |  |
|--|--|--|----------------------------------|--|
| Parameter   Name:<br>Cxxxxx   _____  |  |  | Data type: _____<br>Index: _____ |  |
| Description  |  |  |                                  |  |
| <b>Selection list(Lenze setting printed in bold)</b>                                       |  |  |                                  |  |
| <b>1</b>   |  |  |                                  |  |
| 2  |  |  |                                  |  |
| 3  |  |  |                                  |  |
| ☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ COM ☐ MOT Scaling factor: 1 |  |  |                                  |  |

### Parameter setting in the »Engineer«

In the »Engineer«, a list field is used for parameter setting:

|  | C... | S | Name          | Value                  | Unit |
|--|------|---|---------------|------------------------|------|
|  | 173  | 0 | Mains voltage | 0: 3ph 400V / 1ph 230V |      |
|  |      |   |               | 0: 3ph 400V / 1ph 230V |      |
|  |      |   |               | 1: 3ph 440V / 1ph 230V |      |
|  |      |   |               | 2: 3ph 480V / 1ph 230V |      |
|  |      |   |               | 3: 3ph 500V / 1ph 230V |      |
|  |      |   |               | 4: 3ph 400V / 1ph 115V |      |

#### 17.1.3.3 Parameters with bit-coded setting

##### Description structure

|   |  |                                  |
|---|--|----------------------------------|
| Parameter   Name:<br>Cxxxxx   _____   |  | Data type: _____<br>Index: _____ |
| Description   |  |                                  |
| <b>Value is bit-coded:</b>  |  |                                  |
| Bit 0   |  |                                  |
| ...   |  |                                  |
| Bit 31  |  |                                  |
| <input checked="" type="checkbox"/> Read access <input checked="" type="checkbox"/> Write access <input type="checkbox"/> CINH <input type="checkbox"/> PLC STOP <input type="checkbox"/> No transfer <input type="checkbox"/> COM <input type="checkbox"/> MOT           Scaling factor: 1 |  |                                  |

### Parameter setting in the »Engineer«

The »Engineer« uses a dialog box for parameter setting in which the individual bits can be set or reset. Alternatively, the value can be entered as a decimal or hexadecimal value:

| Bit                                   | Comment        |
|---------------------------------------|----------------|
| <input checked="" type="checkbox"/> 0 | bOut1 inverted |
| <input checked="" type="checkbox"/> 1 | bOut2 inverted |
| <input checked="" type="checkbox"/> 2 | bOut3 inverted |
| <input checked="" type="checkbox"/> 3 | bOut4 inverted |
| <input type="checkbox"/> 4            | Reserved       |
| <input type="checkbox"/> 5            | Reserved       |
| <input type="checkbox"/> 6            | Reserved       |
| <input type="checkbox"/> 7            | Reserved       |

### 17.1.3.4 Parameters with subcodes

#### Description structure

|   |                      |                                  |
|---|----------------------|----------------------------------|
| Parameter   Name:<br>Cxxxxx   _____   |                      | Data type: _____<br>Index: _____ |
| Description   |                      |                                  |
| Setting range (min. value   unit   max. value)  |                      |                                  |
|   |                      |                                  |
| <b>Subcodes</b>   | <b>Lenze setting</b> |                                  |
| Cxxxxx/1  |                      |                                  |
| Cxxxxx/2  |                      |                                  |
| Cxxxxx/3  |                      |                                  |
| Cxxxxx/4  |                      |                                  |
| <input checked="" type="checkbox"/> Read access <input checked="" type="checkbox"/> Write access <input type="checkbox"/> CINH <input type="checkbox"/> PLC STOP <input type="checkbox"/> No transfer <input type="checkbox"/> COM <input type="checkbox"/> MOT           Scaling factor: 1 |                      |                                  |

#### Parameter setting in the »Engineer«

The »Engineer« parameter list displays each subcode individually. The parameters are set as described in the previous chapters.

|  | C... | S | Name             | Value | Unit |
|--|------|---|------------------|-------|------|
|  | 39   | 1 | Fixed setpoint 1 | 40.00 | %    |
|  | 39   | 2 | Fixed setpoint 2 | 60.00 | %    |
|  | 39   | 3 | Fixed setpoint 3 | 80.00 | %    |
|  | 39   | 4 | Fixed setpoint 4 | 0.00  | %    |

### 17.1.4 Parameter attributes

The table footers contain the parameter attributes:

|   |
|---|
| <input checked="" type="checkbox"/> Read access <input checked="" type="checkbox"/> Write access <input type="checkbox"/> CINH <input type="checkbox"/> PLC STOP <input type="checkbox"/> No transfer <input type="checkbox"/> COM <input type="checkbox"/> MOT           Scaling factor: 1 |
|---|

| Attribute  | Meaning  |
|--|--|
| <input checked="" type="checkbox"/> Read access  | Read access to parameter possible.   |
| <input checked="" type="checkbox"/> Write access | Write access to parameter possible.<br>• Please also observe the following attributes:                                 |
| <input checked="" type="checkbox"/> CINH         | Parameter value can only be changed when the controller is inhibited.  |
| <input checked="" type="checkbox"/> PLC STOP     | Parameter value can only be changed when the application is stopped.   |
| <input checked="" type="checkbox"/> No transfer  | Parameter is <b>not</b> transferred to inverter when the command <u>Download parameter set</u> is executed.            |
| <input checked="" type="checkbox"/> COM          | Communication-relevant parameter<br>• This parameter is relevant for parameter data transfer via the (CAN) system bus. |
| <input checked="" type="checkbox"/> MOT          | Motor control parameters   |

### Scaling factor

The "scaling factor" is important for parameter access via a bus system.

| Signal type         | Scaling factor | Resolution       | Value range           |
|---------------------|----------------|------------------|-----------------------|
| Analog (scaled)     | 100            | 16 bits signed   | ± 199.99 %            |
| Angular velocity    | 1              | 16 bits signed   | ± 32767 incr./ms      |
| Position in [units] | 10000          | 32 bits signed   | ± 214748.3647 [units] |
| Digital (BOOL)      | 1              | 8 bits unsigned  | 0 ≡ FALSE; 1 ≡ TRUE   |
| Time                | 1000           | 16 bits unsigned | 0 ... 999.000 s       |
| Selection value     | 1              | 16 bits unsigned | 0 ... 65535           |

**Example 1:** The value "654" of the parameter [C00028/1](#) (AIN1: input voltage) read via a bus system must be divided by the corresponding scaling factor "100" to obtain the actual display value "6.54 V".

$$\frac{\text{Read value (via bus system)}}{\text{Scaling factor}} = \text{Indicated value (Engineer)}$$

[17-1] Conversion formula for read access via bus system

**Example 2:** In order to set the parameter [C00012](#) (acceleration time main setpoint) to the value "123.45 %" via a bus system, the integer value "12345" must be transferred, i.e. the value to be set must be multiplied by the corresponding scaling factor "100".

$$\text{Value to be written (via bus system)} = \text{Value to be set} \cdot \text{Scaling factor}$$

[17-2] Conversion formula for write access via bus system

### Character length

In case of parameters of "VISIBLE\_STRING" data type, the character length is given in addition. This is also important for the parameter access via a bus system.

## 17.2 Parameter list

This chapter lists all parameters of the operating system in numerically ascending order.

### Note!

The parameter descriptions are based on the software version V16.00.00.

#### C00001

| Parameter   Name:<br><b>C00001   Keypad Userlevel</b>  |               | Data type: UNSIGNED_8<br>Index: 24574 <sub>d</sub> = 5FFE <sub>h</sub> |
|--|---------------|--|
| <p>From version 12.00.00 onwards, the extent of menus, submenus and codes shown in the keypad can be adapted by selecting the "userlevel".</p> <ul style="list-style-type: none"> <li>When the userlevel has been changed, the menus of the keypad will be reconfigured according to the selected user level.</li> <li>Independently of the set userlevel, the parameters of the attached communication module will always be displayed completely.</li> </ul> |               |  |
| Selection list   |               | Info   |
| 10   | Standard      | Only the most important menus and codes are displayed on the keypad.   |
| 20   | Expert        | All menus and codes are displayed on the keypad.                       |
| 30   | Service       | Only for servicing purposes (Lenze service).                           |
| Subcodes   | Lenze setting | Info   |
| C00001/1   | 10: Standard  | Keypad UserLevel   |
| <input checked="" type="checkbox"/> Read access <input checked="" type="checkbox"/> Write access <input type="checkbox"/> CINH <input type="checkbox"/> PLC STOP <input type="checkbox"/> No transfer <input type="checkbox"/> COM <input type="checkbox"/> MOT             Scaling factor: 1  |               |  |

#### C00002

| Parameter   Name:<br><b>C00002   Device command</b>   |                              | Data type: UNSIGNED_8<br>Index: 24573 <sub>d</sub> = 5FFD <sub>h</sub> |
|---|------------------------------|--|

## C00142

Parameter | Name: C00142 | Auto-start option

Data type: UNSIGNED\_8  
Index: 24433<sub>d</sub> = 5F71<sub>h</sub>

The **Auto-start option** function describes the starting performance of the inverter after

- connection to the mains and/or switching on the external 24-V supply (Bit 0)
- Deactivation of "Trouble" or "Fault" (Bit 1 / 2)
- Undervoltage (Bit 3)
- Loading the Lenze setting (Bit 4)

▶ [Auto-start option "inhibit at device on"](#)

| Setting range (min. hex value   max. hex value) |                          |      | Lenze setting      |
|---|--------------------------|------|--------------------|
| 0x00  |                          | 0xFF | 0x19 (decimal: 25) |
| Value is bit-coded: (☑ = bit set)               |                          |      |                    |
| Bit 0 ☑   | Inhibit at device on     |      |                    |
| Bit 1 ☐   | Inhibit at trouble       |      |                    |
| Bit 2 ☐   | Inhibit at fault         |      |                    |
| Bit 3 ☑   | Inhibit at undervoltage  |      |                    |
| Bit 4 ☑   | Inhibit at Lenze setting |      |                    |
| Bit 5 ☐   | Reserved                 |      |                    |

## C00148

Parameter | Name:  
**C00148 | LS\_DriveInterface: Error message config.**

Data type: UNSIGNED\_16  
Index: 24427<sub>d</sub> = 5F6B<sub>h</sub>

Selection of the device statuses for which the *bCollectedFail* group error output of SB [LS\\_DriveInterface](#) is to be set to TRUE.

| Setting range (min. hex value   max. hex value) |                                   | Lenze setting   |
|---|-----------------------------------|---|
| 0x0000  |                                   | 0xFFFF  |
|   |                                   | <b>0x0030</b> (decimal: 48)   |
| Value is bit-coded: (☑ = bit set)               |                                   | Info  |
| Bit 0 ☐   | SafeTorqueOff                     |   |
| Bit 1 ☐   | ReadyToSwitchOn                   |   |
| Bit 2 ☐   | SwitchedOn                        |   |
| Bit 3 ☐   | TroubleQSP                        |   |
| Bit 4 ☑   | Trouble                           |   |
| Bit 5 ☑   | Fault                             |   |
| Bit 6 ☐   | Warning                           |   |
| Bit 7 ☐   | ImplsActive                       |   |
| Bit 8 ☐   | CInHlsActive                      |   |
| Bit 9 ☐   | Fail CAN_Management               |   |
| Bit 10 ☐  | Reserved                          |   |
| Bit 11 ☐  | Reserved                          |   |
| Bit 12 ☐  | Reserved                          |   |
| Bit 13 ☐  | Lock bCollectedFail at TroubleQSP | <a href="#">From version 18.00.00 onwards</a>   |
| Bit 14 ☐  | Lock bFail at TroubleQSP          | <a href="#">From version 02.00.00</a><br>1 ≡ The <i>bFail</i> output of the SB <a href="#">LS_DriveInterface</a> is also set in the "TroubleQSP" status.<br>• Advantage: Even in the "TroubleQSP" status, an error occurred before can still be recognised.   |
| Bit 15 ☐  | Use 16BitFailNo.                  | 1 ≡ The short 16-bit error number <i>wStateDetermFailNoShort</i> is provided at the <i>wStateDetermFailNoLow</i> output of the SB <a href="#">LS_DriveInterface</a> .<br>• In this case, the <i>wStateDetermFailNoHigh</i> output is "0".<br>• Advantage: The bus transfer of the error numbers is possible via a data word without changing the interconnection of the technology application. |

## C00322

Parameter | Name:

C00322 | Transmission mode CAN TxPDOs

Data type: UNSIGNED\_8  
Index: 24253<sub>d</sub> = 5EBD<sub>h</sub>

TPDO transmission type according to DS301 V4.02

- The following transmission modes are supported:
  - 0: Synchronous and acyclic
  - 1 ... 240: Synchronous and cyclic
  - 252: Synchronous - RTR only
  - 253: Asynchronous - RTR only
  - 254: Asynchronous - manufacturer-specific
  - 255: Asynchronous - device-profile specific
- The basic setting for all PDOs is "Asynchronous - manufacturer-specific" (254).
- Illustration of the CANopen objects [I-1800/2](#) ... [I-1803/2](#) (see DS301 V4.02).

## C00323

Parameter | Name: **C00323 | Transmission mode CAN Rx PDOs**

Data type: UNSIGNED\_8  
Index: 24252<sub>d</sub> = 5EBCh

RPDO transmission type according to DS301 V4.02

- In the case of the RPDO serves as monitoring setting in the case of sync-controlled PDOs.
- The following transmission modes are supported:
  - 0: Synchronous and acyclic
  - 1 ... 240: Synchronous and cyclic
  - 252: Synchronous - RTR only
  - 253: Asynchronous - RTR only
  - 254: Asynchronous - manufacturer-specific
  - 255: Asynchronous - device-profile specific
- The basic setting for all PDOs is "Asynchronous - manufacturer-specific" (254).
- Illustration of the CANopen objects [I-1400/2](#) ... [I-1403/2](#) (see DS301 V4.02).

## C00324

Parameter | Name:

C00324 | CAN transmission blocking time

Data type: UNSIGNED\_16

Index: 24251<sub>d</sub> = 5EBB<sub>h</sub>

Blocking time for the transmission of the emergency telegram and the process data

Note:

If the "Asynchronous - manufacturer-specific/device profile-specific" transmission type is set, the transmission cycle timer is reset to 0 if event-controlled transmission has been triggered.

Example: Cycle time (C00356/x) = 500 ms, blocking time = 100 ms, data change sporadically:

- In the case of a sporadic data change < 500 ms, due to the blocking time set, transmission takes place every 100 ms (event-controlled transmission) as quickly as possible.
- In the case of a sporadic data change > 500 ms, due to the cycle time set, transmission takes place every 500 ms (cyclic transmission).

## C00357

Parameter | Name:

C00357 | CAN monitoring times

Data type: UNSIGNED\_16

Index: 24218<sub>d</sub> = 5E9A<sub>h</sub>

Mapping of the RPDO event time (see DS301 V4.02)

If a value unequal to "0" is entered, the RPDO is not expected before the set time has expired.

If the RPDO is not received within the expected time, the response set in C00593/1...4 will be triggered.

## C00400

Parameter | Name:

C00400 | LS\_PulseGenerator

Data type: UNSIGNED\_16

Index: 24175<sub>d</sub> = 5E6F<sub>h</sub>

Time setting of the pulse to be output by the SB [LS\\_PulseGenerator](#)

Note:

The real length of the low or high level at the *bSquareWave* output is always 1 ms higher than set here in subcode 1 or 2. If "0 ms" is set, a level with a length of 1 ms is created length, for instance, and if "1000 ms" is set, a level with a length of 1001 ms is created.

| Setting range (min. value   unit   max. value) |    |       |
|--|----|-------|
| 0  | ms | 60000 |

| Subcodes | Lenze setting | Info   |
|----------|---------------|--|
| C00400/1 | 1000 ms       | Length of the low level (break) + 1 ms   |
| C00400/2 | 1000 ms       | Length of the high level + 1 ms  |
| C00400/3 | 100 ms        | Delay time for status signal <i>bFirstCycleDone</i> <ul style="list-style-type: none"><li>The <i>bFirstCycleDone</i> status signal is set to TRUE when the first task cycle is complete and the time set here has expired.</li></ul> |

## C00426

Parameter | Name: C00426 | SSI encoder: Data bits

Data type: UNSIGNED\_8  
Index: 24149<sub>d</sub> = 5E55<sub>h</sub>

Example: Setting for an SSI encode with the coding "8192x4096":

- 8192 = 2<sup>13</sup> = 13 bits Multiturn → C00426/4 = 13
- 4096 = 2<sup>12</sup> = 12 bits Singleturn → C00426/2 = 12
- This results in a data word length of 25 bits → C00426/1 = 25
- Start bit Singleturn = bit 0 → C00426/3 = 0
- Start bit Multiturn = bit 12 → C00426/5 = 12

Encoder/feedback system: SSI encoder

## C00653

Parameter | Name:

C00653 | Sensibility - Setpoint feedforward control

Data type: UNSIGNED\_8  
Index: 23922<sub>d</sub> = 5D72<sub>h</sub>

From version 12.00.00

Selection of the sensitivity of the differential setpoint feedforward control

• Depending on the selection, the number of indicated higher-order bits is evaluated.

Note:

The most significant bit determines the sign of the value, the remaining bits determine the numerical value.

| Selection list |               | Info                                       |

## C00905

Parameter | Name:

C00905 | Motor phase direction of rotation

Data type: UNSIGNED\_8

Index: 23670<sub>d</sub> = 5C76<sub>h</sub>

To correct such misconnected motor phases, the rotating field of the inverter's output can be reversed by selecting "1: Inverted". In this case, a phase will be reversed at the output of the inverter.

**Note:**

Up to and including version 07.00.00, this function may only be activated for the following motor control types:

- V/f characteristic control (VFCplus)
- Energy-saving V/f characteristic control (VFCplusEco)

For all other motor control types, this function must not be activated because the set control mode would not work in that case!

From version 12.00.00, this function may be activated for all motor control types with the exception of the ones for synchronous motor.

The activation of this function does not affect the control types for synchronous motor since these control types require an in-phase connection of the synchronous motor.

| Selection list(Lenze setting printed in bold) |              |
|---|--------------|
| 0   | Not inverted |
| 1   | Inverted     |

## C01122

Parameter | Name: **C01122 | Sync phase position**

Data type: UNSIGNED\_16  
Index: 23453<sub>d</sub> = 5B9D<sub>h</sub>

Phase position for device synchronisation

- The phase position determines the zero-time of the internal system cycle with regard to the synchronisation signal (bus cycle). Since PDO processing is an inherent part of the system part of the application, the instant of acceptance of the PDOs is postponed as well by a changed phase position.
- With a setting = 0, the system cycle starts simultaneously with the synchronisation signal.
- With a setting > 0, the internal system cycle starts earlier by the set time with regard to the synchronisation signal (the phase position acts negatively).
- Intelligent communication modules define the optimal time with activated synchronisation by themselves. In this case, a manual change is not possible.
- The decisive factor for defining C01122 is the time where all nodes are provided with valid PDOs.

Example: If the phase position is set to 550 µs, the system part of the application starts 550 µs before the arrival of the synchronisation signal.

## C01229

Parameter | Name: **C01229 | MCK: Position limiting values** Data type: INTEGER\_32  
Index: 23346<sub>d</sub> = 5B32<sub>h</sub>

Software limit position for limiting the valid traversing range

- The error response to leaving the valid traversing range can be parameterised in [C00595/3](#) and [C00595/4](#).

**Note:**  
For limiting the traversing range by means of software limit positions, the home position must be known and the positive software limit position must be higher than the negative software limit position!

## C01230

Parameter | Name: **C01230 | Manual jog: Setting**

Data type: UNSIGNED\_8  
Index: 23345<sub>d</sub> = 5B31<sub>h</sub>

Settings for "Manual jog" mode

[Manual jog](#)

| Setting range (min. hex value   max. hex value) |                               | Lenze setting   |
|---|-------------------------------|---|
| 0x00  |                               | 0xFF  |
| 0x00 (decimal: 0)                               |                               |   |
| Value is bit-coded: (☑ = bit set)               |                               | Info  |
| Bit 0 ☐   | Breakpoints 1..4 on           | 1 ≙ approach of the parameterised breakpoint in manual jog direction  |
| Bit 1 ☐   | Time-based start of 2nd speed | 1 ≙ Automatic change-over to second manual speed after the waiting time set in <a href="#">C01235/1</a> .   |
| Bit 2 ☐   | HW limit switch on            | 1 ≙ Travel range monitoring via hardware limit switch is active. The error response can be parameterised in <a href="#">C00595/1</a> and <a href="#">C00595/2</a> .   |
| Bit 3 ☐   | SW limit switch on            | 1 ≙ Travel range monitoring via parameterised software limit positions is active. The error response can be parameterised in <a href="#">C00595/3</a> and <a href="#">C00595/4</a> .  |
| Bit 4 ☐   | Reserved                      |   |
| Bit 5 ☐   | Maximum jerk                  | 1 ≙ The maximum jerk is calculated based on the acceleration and S-ramp time of the current profile and the sequence profile. This is then used in an accelerated drive for reducing the acceleration to 0 or for acceleration of the sequence profile.<br>• Ab Version 14.00.00<br>▶ <a href="#">Setting or activation of maximum jerk for traversing profiles</a> |
| Bit 6 ☐   | Reserved                      |   |
| Bit 7 ☐   | Position controller off       | 1 ≙ Position controller is deactivated. Thus, the compensation of the following error is switched off.  |

☒ Read access   ☒ Write access   ☐ CINH   ☐ PLC STOP   ☐ No transfer   ☐ COM   ☐ MOT

## C02878

|  |  |        |   |  |  |
|--|--|--------|---|--|--|
| Parameter   Name:<br><b>C02878   KTY motor temperature compensation</b>  |  |        | Data type: UNSIGNED_16<br>Index: 21697 <sub>d</sub> = 54C1 <sub>h</sub> |  |  |
| From version 02.00.00  |  |        |   |  |  |
| A temperature compensation over the detected motor temperature (display in <a href="#">C00063/1</a> ) serves to compensate inaccuracies in the output torque within the motor control in case of temperature changes of the asynchronous or synchronous motor.   |  |        |   |  |  |
| <b>Note!</b>   |  |        |   |  |  |
| In the Lenze setting, the temperature compensation within the motor control is activated. The temperature compensation, however, is only active with speed encoder selection "3: Multi encoder" or "4: Resolver" in <a href="#">C00495</a> as well as error-free KTY temperature detection (display in <a href="#">C00063/1</a> ≠ 255 °C). |  |        |   |  |  |

# 17      Parameter reference

## 17.7      Table of attributes

---

### 17.7      Table of attributes

The table of attributes contains information that is required for communication with the inverter via parameters.

## How to read the table of attributes:

| Column |        | Meaning  | Entry                                 |   |
|--------|--------|--|---------------------------------------|---|
| Code   |        | Parameter name   | Cxxxxx                                |   |
| Name   |        | Parameter short text (display text)  | Text                                  |   |
| Type   |        | Parameter type   | Selection list                        | Value from selection list   |
|        |        |  | Bit coded                             | Bit coded value   |
|        |        |  | Linear value                          | Value with setting range  |
|        |        |  | String                                | String  |
| Index  | dec    | Index under which the parameter is addressed.<br>The subindex for array variables corresponds to the Lenze subcode number. | 24575 - Lenze code number             | Is only required for access via a bus system.   |

## 18 Working with the FB Editor

The function block editor (in the following called "FB Editor") is available in the »Engineer« from the "StateLine" device version.

The FB Editor can be used to carry out an online monitoring of the technology application running in the device (e.g. for diagnostic purposes) and reconfigure the I/O interconnection of the technology application.

### Functional range

The options for processing function block interconnections depend on the device version:

| Function   | Inverter Drives 8400 |            |           |
|--|----------------------|------------|-----------|
|  | StateLine C          | HighLine C | TopLine C |
| I/O interconnection can be reconfigured  | ●                    | ●          | ●         |
| Application interconnection can be reconfigured  | ●                    | ●          | ●         |
| Free interconnection   | (●)                  | ●          | ●         |
| (●) Free interconnection for "StateLine C" is only available from version 12.00.00 and »Engineer« V2.17. |                      |            |           |

### Note!

The illustrations of the FB Editor user interface and the dialog boxes in this documentation are based on the »Engineer« V2.10.

### 18.1 Basics

Using the function block interconnection, any signal interconnection can be implemented. Various FBs are available for digital signal processing, signal conversion and logic modules.

For special tasks it has proved of value to use the integrated technology applications as a basis for modifications or extensions of the available FB interconnections. Depending on the device version (see [Functional range](#)), the experienced user has the opportunity to implement own drive solutions independent of the predefined technology applications by using the "free interconnection".

For this purpose, the FB Editor provides the following functions:

- Copying & pasting of interconnection elements (also device-independent)
- Export & import of the interconnection
- Comparison of two interconnections (also online <-> offline comparison)
- Overview window and zoom functions
- Comments on the signal flow
- Online monitoring

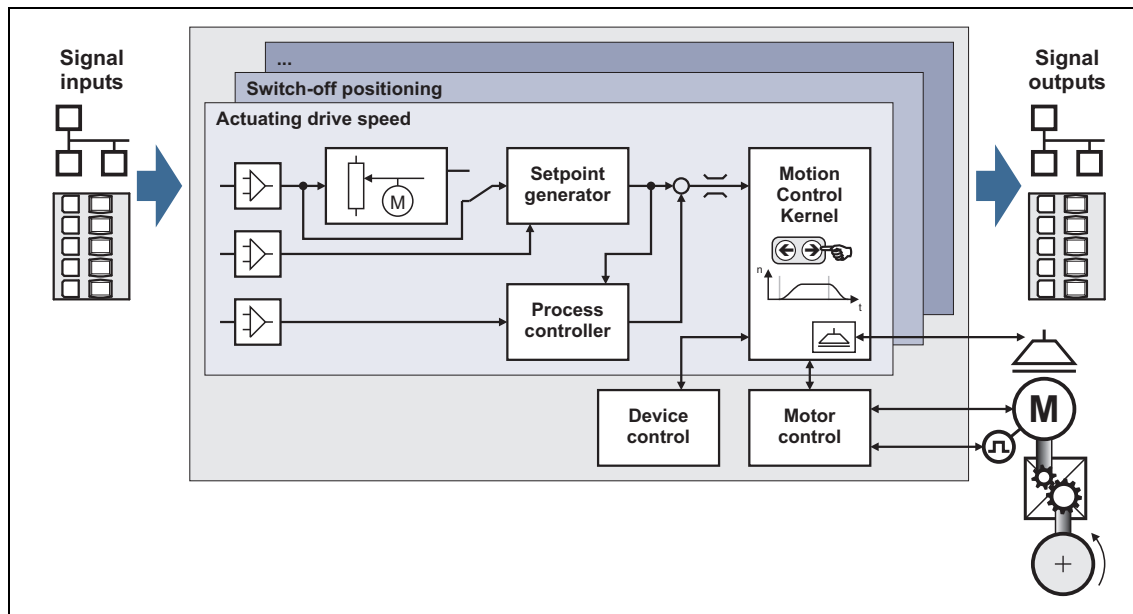

The option to mask out non-used inputs and outputs of modules is also sensible to minimise the complexity of the FB interconnection and to adapt the clarity of the interconnection to the customers need.

All graphical information of the FB interconnection view (positions of the FBs, line or flag presentation of the connection, visibility of the inputs/outputs) are saved with the parameter set in the memory module of the inverter and can be uploaded any time into the FB Editor of the »Engineer« even if the Engineer project is not available.

### 18.1.1 Basic components of a drive solution

A drive solution consists of the following basic components:

- Signal inputs (for control and setpoint signals)
- Signal flow of the technology application
- Signal outputs (for status and actual value signals)

[18-1] Basic components of a drive solution

Regarding the 8400 device series, these three components are available for the FB interconnection and classified as follows:

| Module type       | Name    | Task  | Example  |
|-------------------|---------|---|--|
| Function block    | L_name  | General function block for free interconnection (only HighLine)   | <a href="#">L_Compare_1</a><br><a href="#">L_PCTRL_1</a>   |
| System block      | LS_name | Signal interface to inverter-internal functions   | <a href="#">LS_DigitalInput</a><br><a href="#">LS_DriveInterface</a>   |
| Port block        | LP_name | <ul style="list-style-type: none"> <li>• Process data communication via a fieldbus using a communication module</li> <li>• Process data communication via CAN on board</li> </ul> | <a href="#">LP_CanIn1</a><br><a href="#">LP_CanOut1</a><br><a href="#">LP_MciIn</a><br><a href="#">LP_MciOut</a> |
| Application block | LA_name | Block for a technology application  | <a href="#">LA_NCtrl</a><br><a href="#">LA_SwitchPos</a>   |

Further information on the individual modules can be obtained from the following subchapters!

### 18.1.1.1 What is a function block?

A function block (FB) can be compared with an integrated circuit that contains a certain control logic and provides one or several values when being executed.

- The function blocks are classified alphabetically in a "function library".
- Each function block has a unique identifier and a processing number which defines the position at which the function block is calculated during runtime.

[18-2] Information on a function block in the FB Editor

#### Tip!

A detailed description of all available function blocks can be found in the main chapter "[Function library](#)". (1468)

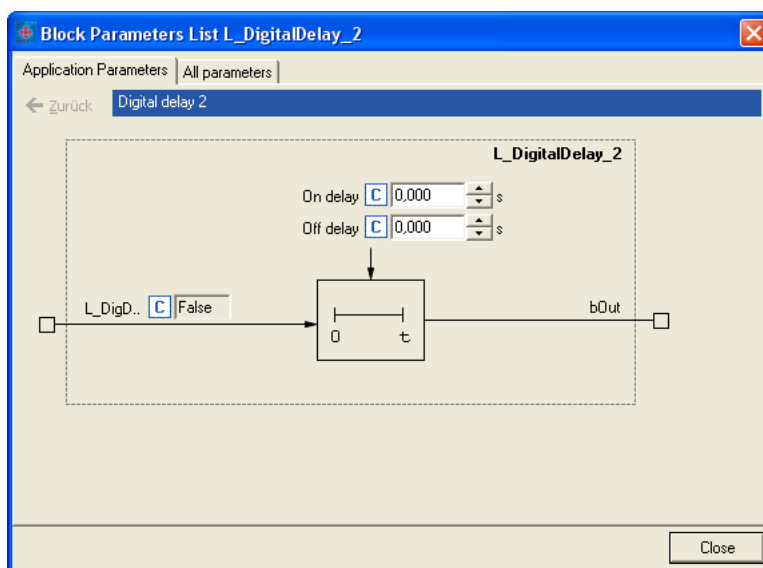

### 18.1.1.2 Parameterisable function blocks

Some function blocks have parameters which serve to change particular settings during operation, if required, or which display actual values & status information.

- The  icon in the head of the module, a double-click on the module, or the **Parameter...** command in the *Context menu* of the module serve to open the parameterisation dialog or the parameter list for the module.

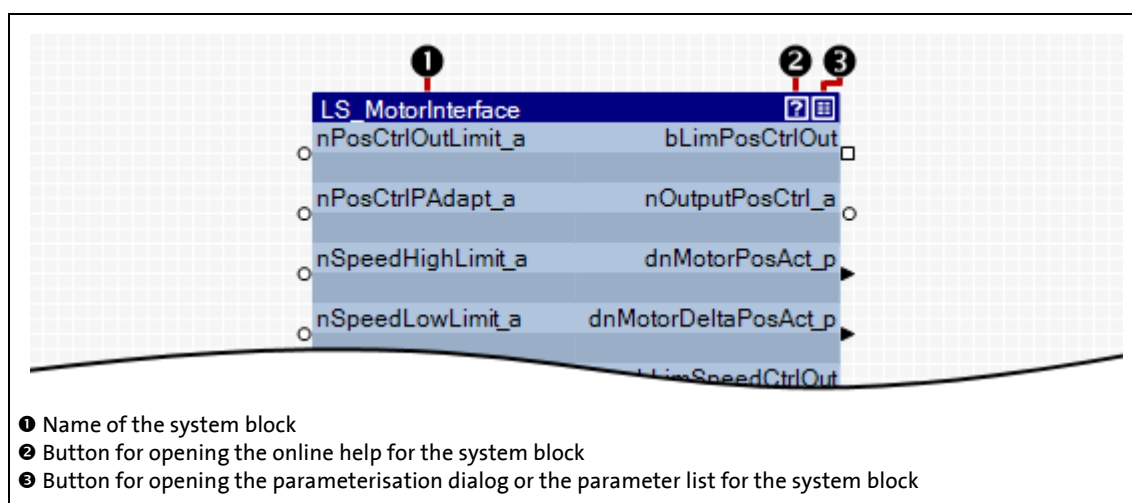

#### Example

Parameterisation dialog for the FB **L\_DigitalDelay\_2**:

### 18.1.1.3 What is a system block?

System blocks are a special variant of a function block. They partly activate real hardware, e. g. the digital and analog inputs/outputs and the motor control.

[18-3] Example: System block "LS\_MotorInterface" for mapping the motor control

#### 18.1.1.4 What is a port block?

A port block is a signal interface to a fieldbus. Input/output ports represent the input and output process data of the fieldbus.

- Port blocks LP\_CanIn/LP\_CanOut: Signal interface to the CAN bus
- Port blocks LP\_MciIn/LP\_MciOut: Signal interface to a plugged fieldbus module

If, for instance, the inverter is to be controlled via CAN bus or a fieldbus module, the input/output ports are connected to the application block (device-internal signal processing) in the I/O level of the FB Editor.

[18-4] Example: Input port "LP\_CanIn1" and output port "LP\_CanOut1"

#### 18.1.1.5 What is an application block?

The application/technology function set in [C00005](#) is shown as application block in the I/O level of the FB Editor.

The application block comprises the signal flow processing generated via function block interconnection for the selected application in each case (e.g. "actuating drive speed" or "switch-off positioning"). The function block interconnection is shown in detail on the application level.

#### Tip!

Every application block features so-called "free inputs and outputs" which you can use to transfer signals from the I/O level to the application level and vice versa.

- In the Lenze setting, these connectors are hidden in the function block editor.
- These connections can be shown via the **Connector visibilities** command in the *Context menu* of the application block.

### 18.1.2 Conventions used for input/output identifiers

This chapter describes the conventions used for the identifiers of the inputs/outputs of the blocks. The conventions ensure a uniform and consistent terminology and make reading and comprehending the interconnection and application easier.

#### Tip!

The conventions used by Lenze are based on the "Hungarian Notation". This ensures that the most significant characteristics of the corresponding input/output (e.g. the data type) can be instantly recognised from its identifier.

An identifier consists of

- a data type entry
- an identifier (the "proper" name of the input/output)
- an (optional) signal type specification

#### Data type entry

The data type entry provides information about the data type of the corresponding input/output:

| Data type entry | Meaning | Resolution | Value range                |
|-----------------|---------|------------|----------------------------|
| b               | BOOL    | 1 bit      | 0 ≡ FALSE / 1 ≡ TRUE       |
| dn              | DINT    | 32 bits    | -2147483647 ... 2147483647 |
| n               | INT     | 16 bits    | -32767 ... 32767           |
| w               | WORD    | 16 bits    | 0 ... 65535                |

#### Identifier

The identifier is the proper name of the input/output and should indicate the application or function.

- Identifiers always start with a capital letter.
- If an identifier consists of several "words", then each "word" must start with a capital letter.
- All other letters are written in lower case.

### Signal type entry

In general, it is possible to assign a certain signal type to the inputs and outputs of the Lenze function blocks. There are e.g. digital, scaled, position, acceleration and speed signals.

- A corresponding ending (preceded by an underscore) is added to the identifier of the corresponding input/output to indicate the signal type.

| Signal type entry<br>& port symbol<br>in the FB Editor                                      | Meaning          | Resolution | Value range  |
|---|------------------|------------|--|
| <u>_a</u>  | Analog/scaled    | 16 bits    | ± 199.99 %   |
| <u>_v</u>  | Angular velocity | 16 bits    | ± 30000.0 rpm                                      |
| <u>_p</u>  | Position         | 32 bits    | -2 <sup>31</sup> ... 2 <sup>31</sup> -1 increments |
|            | Digital (BOOL)   | 8 bits     | 0 ≡ FALSE; 1 ≡ TRUE                                |
|            | Other (WORD)     | 16 bits    | 0 ... 65535  |
|            | Other (DINT)     | 32 bits    | -2147483647 ... 2147483647                         |

### 18.1.3 Scaling of physical units

With regard to the parameter setting & configuration of the inverter it is very helpful to know the signal types and their scaling listed in the following table, which are used to process physical values (e.g. an angular velocity or position) in the function block interconnection.

| Signal type entry<br>& port symbol<br>in the FB Editor  | Meaning          | Scaling              |                              |
|---|------------------|----------------------|------------------------------|
|   |                  | External value       | ≡ internal value             |
| <u>_a</u>  | Analog/scaled    | 100 %                | ≡ 2 <sup>14</sup> ≡ 16384    |
| <u>_v</u>  | Angular velocity | 15000 rpm            | ≡ 2 <sup>14</sup> ≡ 16384    |
| <u>_p</u>  | Position         | 1 encoder revolution | ≡ 2 <sup>16</sup> increments |

## 18.2

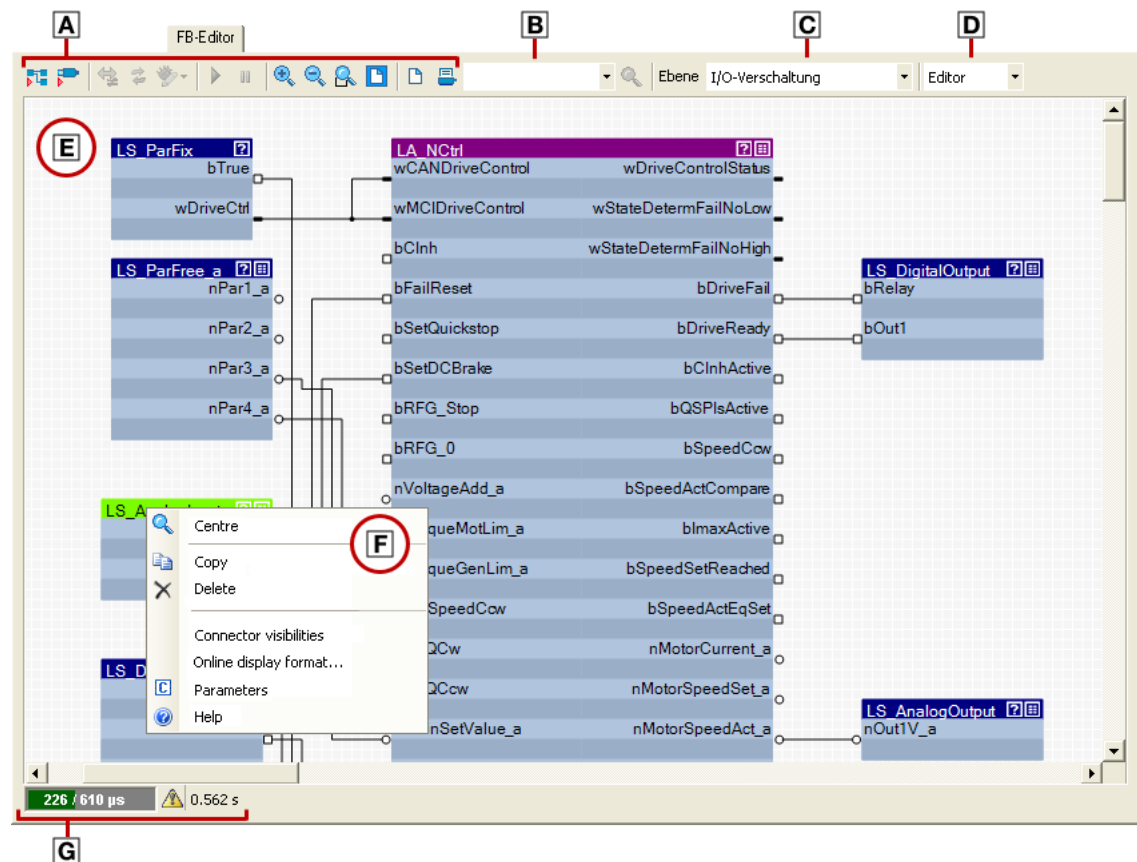

## User interface

**How to access the FB Editor:**

1. Go to the *Project view* and select the 8400 inverter.
2. Go to *Workspace* and select the **FB Editor** tab.

The FB Editor displays the wiring of the technology function selected in [C00005](#). The interconnection of the I/Os of the inverter depends on the control mode selected in [C00007](#).

The user interface of the FB Editor includes the following control and function elements:

A [Toolbar](#)

B [Search function](#)

C [Plane selection](#)

D [Editor view/overview](#)

E Drawing area

F [Context menu](#)

G [Status bar](#)

Not shown:  
[Overview](#)

**Tip!**

Go to the »Engineer« toolbar and click the  icon to hide the *Project View* and the *Message Window*. This increases the *Workspace* available for the FB Editor. A renewed click on the symbol shows the *Project View* and the *Message Window* again.

### 18.2.1 Toolbar

The FB Editor is provided with an individual toolbar in the upper position which in the following text is called *FB Editor toolbar*.

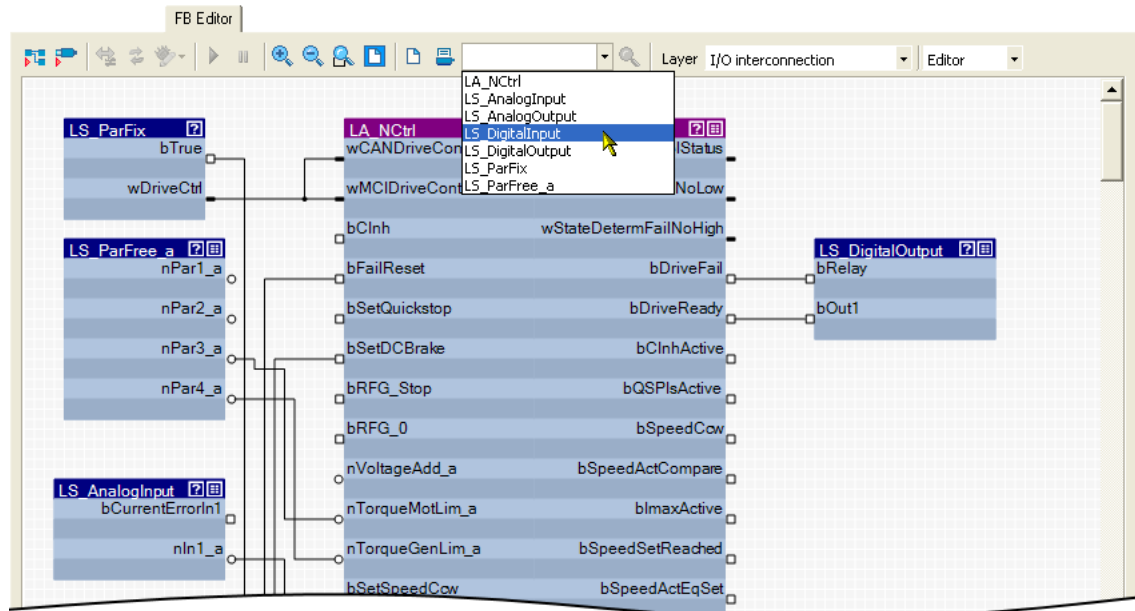

- Click on an icon to execute the corresponding function.

| Symbol  | Function  |
|---|---|
|    | Insert function block or system block<br><a href="#">▶ Inserting a function block (1438)</a><br><a href="#">▶ Inserting a system block (1440)</a> |
|    | <a href="#">Insert port block (1442)</a>  |
|    | <a href="#">Adjusting online and offline interconnection (1461)</a>   |
|    | Acknowledge error in the interconnection / reload interconnection   |
|    | Correct interconnection   |
|    | Start online monitoring   |
|    | Interrupt online monitoring   |
|    | Close online monitoring   |
|   | Enlarge view of interconnection   |
|  | Reduce view of interconnection  |
|  | Enlarge cutout of interconnection   |
|  | Show entire interconnection in the drawing area   |
|  | Show print view   |
|  | <a href="#">Printing the interconnection (1462)</a>   |
|  | <a href="#">Search function (1425)</a>  |

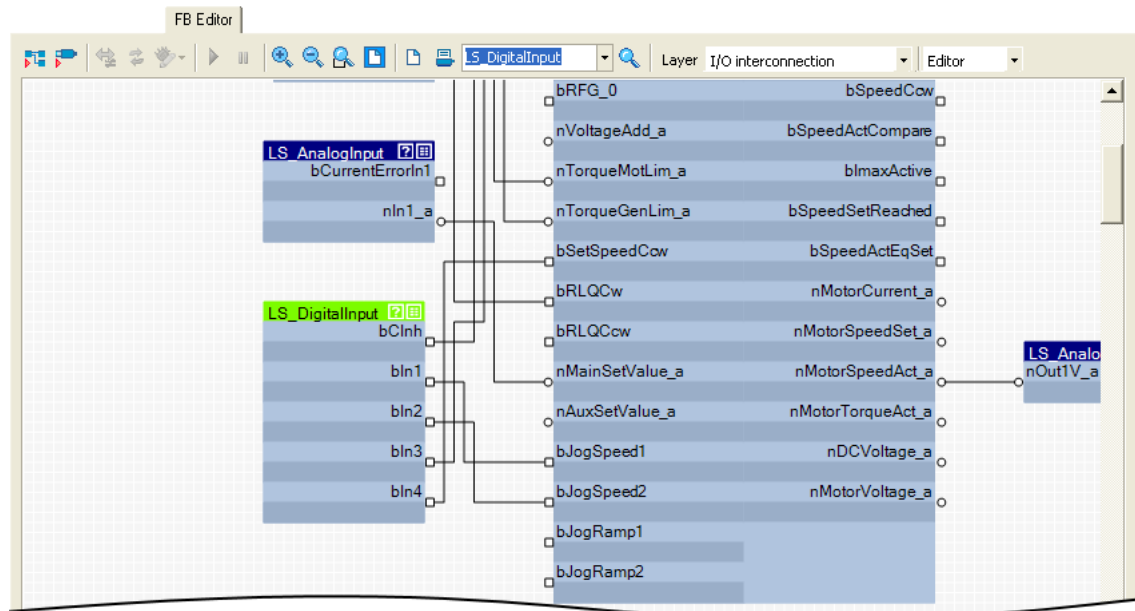

### 18.2.2 Search function

Use the search function to get quickly to a certain module of the interconnection.

- The list field of the search function contains all function blocks, system blocks, and port blocks of the interconnection:

- When you select a module in the list field, this module is zoomed in and selected at the same time (the following example shows the **LS\_DigitalInput** system block):

**Tip!**

You can also enter any search text in the input field.

- If you click the  icon, the cutout is moved to the object which contains this search text.
- Another click on the  icon leads to a new search. Thus, you can navigate successively to all objects which contain the entered search text.
- The search text does not consider case sensitivity.

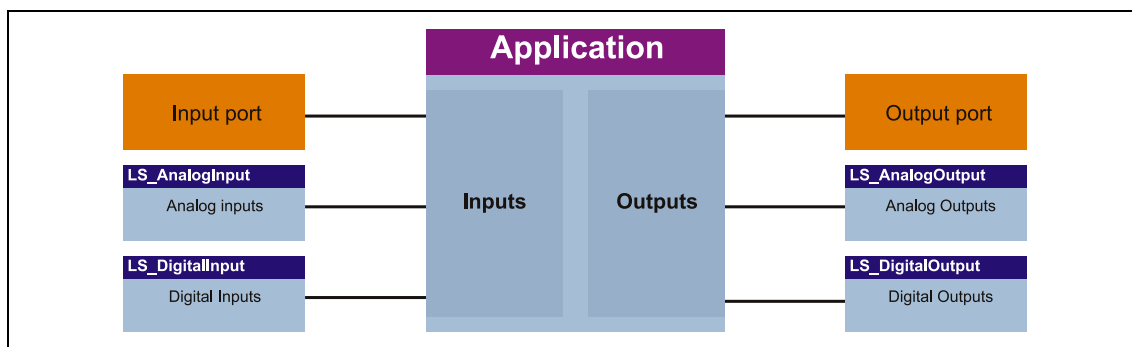

### 18.2.3 Plane selection

Go to the **Level selection** list field and select the interconnection level to be displayed.

#### "I/O interconnection" level

This level displays only the I/O interconnection of the currently selected technology application for a better overview.

- Details of the application are masked out in this level.
- The interconnection of the I/Os of the inverter with the inputs and outputs of the application in detail depends on the control mode selected in [C00007](#).
- The parameterisation dialogs on the **Application parameter** tab correspond to the application block displayed in this level.

[18-5] Schematic diagram of "I/O interconnection"

### "Application interconnection" level

This level displays the interconnection of the application selected in [C00005](#) in detail. All function blocks used in the application and the system blocks which provide the interfaces to the drive and motor interface and to the MotionControlKernel (MCK) are displayed with their connections.

- The interconnection of the I/Os of the inverter with the inputs and outputs of the application is masked out in this level.

[18-6] Schematic diagram of "Application interconnection"

#### Tip!

Every application block features so-called "free inputs and outputs" which you can use to transfer signals from the I/O level to the application level and vice versa.

- In the Lenze setting, these connectors are hidden in the function block editor.
- These connections can be shown via the **Connector visibilities** command in the *Context menu* of the application block.

### "Free interconnection" level

This level serves to implement an individual drive solution for the device versions "Stateline C" (from version 12.00.00 and »Engineer« V2.17), "HighLine C" and "TopLine C".

#### Note!

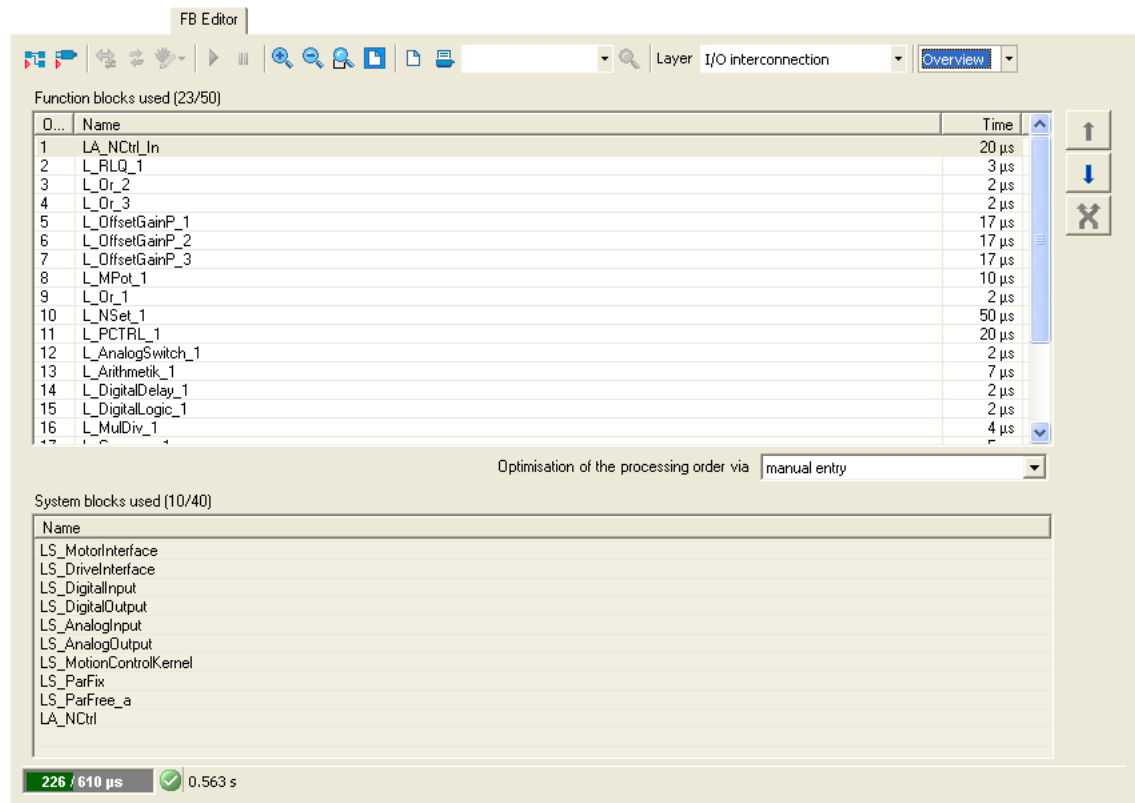

When you select the "Free interconnection" level for the first time, you are prompted to confirm whether the interconnection from the I/O level and the application level are to be combined and copied into this level.

When you confirm this confirmation prompt with **Yes**, the I/O level and the application level are not available anymore. This action can only be undone by resetting the application to a predefined Lenze application! ▶ [Resetting changed interconnection](#) (1460)

### 18.2.4 Editor view/overview

Use the list field at the top right to change from the Editor to the overview and vice versa.

The overview shows all function blocks used of the interconnection in the upper list field in the order of their processing. The lower list field shows all used system blocks.

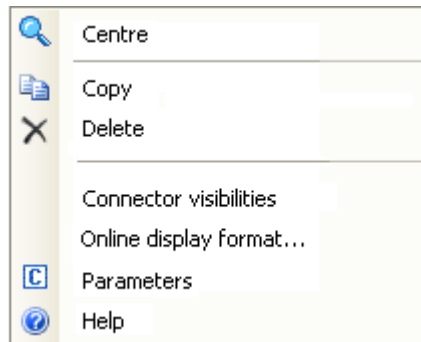

- The processing order of the function blocks can be optimised manually or according to an automatically generated selection. ▶ [Changing the processing order](#) (1455)

### 18.2.5 Context menu

You can open a *context menu* via the right mouse button for each object (function block, system block, line, comment, etc.) and for the drawing area:

- The contents of the *context menu* depend on the type of object you click on.
- Example: *Context menu* for a function block:

### 18.2.6 Status bar

The status bar of the FB Editor shows, among other things, information about the system load and the error status of the interconnection:

| Symbol                                       | Meaning  |
|--|--|
| <b>A System load</b>                         |  |
|  | Here: out of the available computing time of 610 µs, 226 µs are required by the application. |
| <b>B Error status of the interconnection</b> |  |
|  | The interconnection has no errors and no warnings  |
|  | The interconnection has errors and/or warnings   |
| <b>C Communication status</b>                |  |
|  | Offline  |
|  | Online   |
|  | Communication error  |
| <b>D Adjustment status</b>                   |  |
|  | Offline and online interconnection match   |
|  | Offline and online interconnection are different   |
| <b>E Update rate for monitoring values</b>   |  |

### 18.2.7 Overview

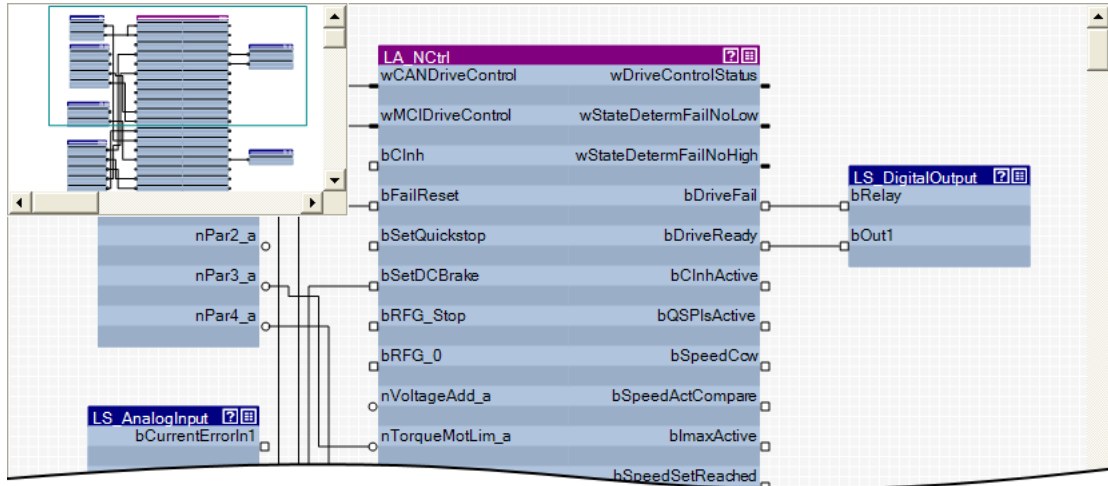

The overview window shows the drawing area in a reduced view. The overview window serves to e.g. move quickly through a more complex interconnection.

#### How to show the monitor window:

Go to the *Context Menu* of the drawing area and select the **Overview Window**.

- If you execute this command again, the overview window is hidden again.

- The green frame in the overview window indicates the interconnection cutout that is currently displayed in the drawing area.
- Use the mouse pointer to shift and resize the cutout to be displayed.

#### How to shift the cutout presented in the drawing area:

1. Position the mouse pointer to the green frame in the overview window.
  - The mouse pointer symbol becomes a positioning cross.
2. Click left mouse button and shift the green frame to its new position by keeping the mouse button pressed, so that the desired cutout of the interconnection is displayed in the drawing area.

### How to redefine the cutout to be presented:

In the overview window draw a frame around the area of the interconnection which is to be presented in the drawing window by keeping the left mouse button pressed:

- The aspect ratio of the frame is automatically adapted to the aspect ratio of the drawing area.
- According to the size of the frame that is drawn, also the presentation size of the objects in the drawing area changes.

### Tip!

Go to the *FB Editor toolbar* and click the  icon to adapt the view size so that all objects included in the interconnection are visible in the drawing area.

### Automatic scroll ("AutoScroll function")

If you reach a window limitation in the drawing area when shifting an object or in the overview window when shifting the green frame, and if you then shortly hold the mouse pointer in this position, an automatic scrolling into the corresponding direction is carried out:

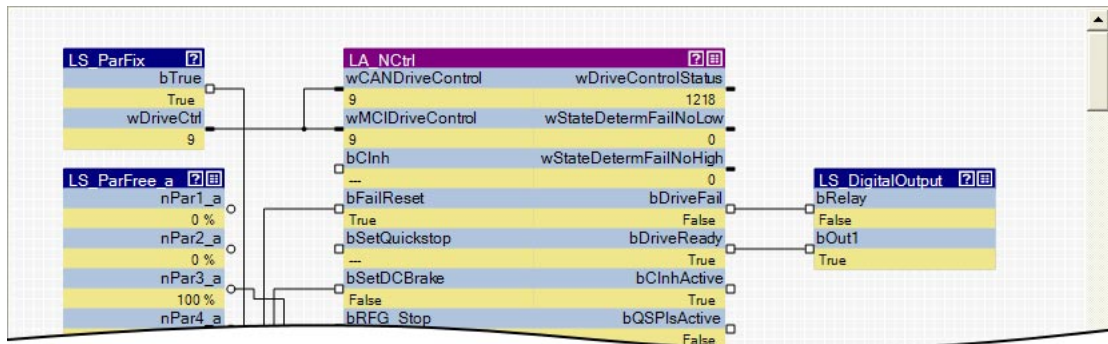

### 18.3 Using the FB Editor as "Viewer"

The main purpose of the FB Editor is the individual configuration of the selected technology application. However, you can also use the FB Editor to

- make a diagnosis of the application (when an online connection has been established),
- get a better understanding for the operating mode of the application,
- use the interconnection as an alternative parameterisation access.

#### Diagnostics of the application

When an online connection to the inverter has been established, the current values are displayed at the inputs and outputs of the objects:

- Process-scaled signals can be scaled in a "user-defined" way for easy diagnostics in the FB Editor.  
   ▶ [Change online display format](#) (1435)

#### Getting a better understanding for the operating mode of the application

Make yourself familiar with the signal flow of the interconnection to get a better understanding of the operating mode of the application or individual functional areas.

- The  symbol in the head of the block or the **Help** command in the *context menu* for the block serve to open the online help for the block.

#### Using the interconnection as an alternative parameterisation access

- The  icon in the head of the module, a double-click on the module, or the **Parameter...** command in the *Context menu* of the module serve to open the parameterisation dialog or the parameter list for the module.

### 18.3.1 Following connections of inputs and outputs

In addition to the [Search function](#) you can use the *context menu* of inputs and outputs to follow connections and quickly reach certain signals.

#### How to navigate from one output to another connected input:

1. Open the *context menu* (right mouse button) of the port symbol at the output.
  - The *context menu* for the port symbol contains all inputs which are connected to the output:

2. Select input in the *context menu* to which you want to navigate.
  - As a result, the selected input is displayed in the centre of the drawing area (in this example: nGPAnalogSwitchOut\_a):

### How to navigate from one input to another connected output:

If the input is connected to a flag:

- Double-click the flag:

If the input is connected to a line:

1. Open the *context menu* (right mouse button) of the port symbol at the output:

2. Select output in the *context menu*.
  - Since an output can only be connected to an input, the *context menu* contains only an output.

The output is displayed in the centre of the drawing area.

### 18.3.2 Keyboard commands for navigation

| Keyboard command       | Function  |
|------------------------|---|
| <Picture ▲ >           | Scroll up   |
| <Picture ▼ >           | Scroll down   |
| <Shift> + <picture ▲ > | Scroll to the left                                      |
| <Shift> + <picture ▼ > | Scroll to the right                                     |
| <POS1>                 | Scroll to the left edge of the interconnection          |
| <END>                  | Scroll to the right edge of the interconnection         |
| <Ctrl> + <Pos1>        | Scroll to the left upper corner of the interconnection  |
| <Ctrl> + <End>         | Scroll to the right lower corner of the interconnection |

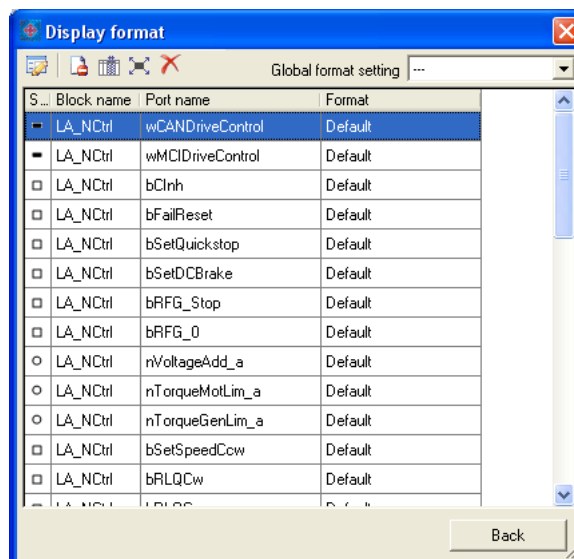

### 18.3.3 Change online display format

For online monitoring in the FB Editor the display format of the input and output data of a block can be adapted individually. Process-scaled signals can be scaled in a "user-defined" way for easy diagnostics in the FB Editor. Thus, the display of these signals gets a process reference.

#### How to change the data display format of block inputs/outputs:

- Go to the *context menu* of the block and select the **Online display format** command.
  - Tip:** You can call the *context menu* of a block by clicking with the right mouse button on the header of the block.
  - The *Display format* dialog box is displayed:

- Select the inputs/outputs from the list the display format of which is to be changed.
  - Note:** In the **Global format setting** list field the "---" entry must be selected so that the display format can be changed.
  - If you click further inputs/outputs while pressing **<Ctrl>** they are added to an already existing selection (multi-selection).
  - The **<Shift>** key serves to select a related area of inputs/outputs.
  - More functions:

Display masked out connections

Display additional information

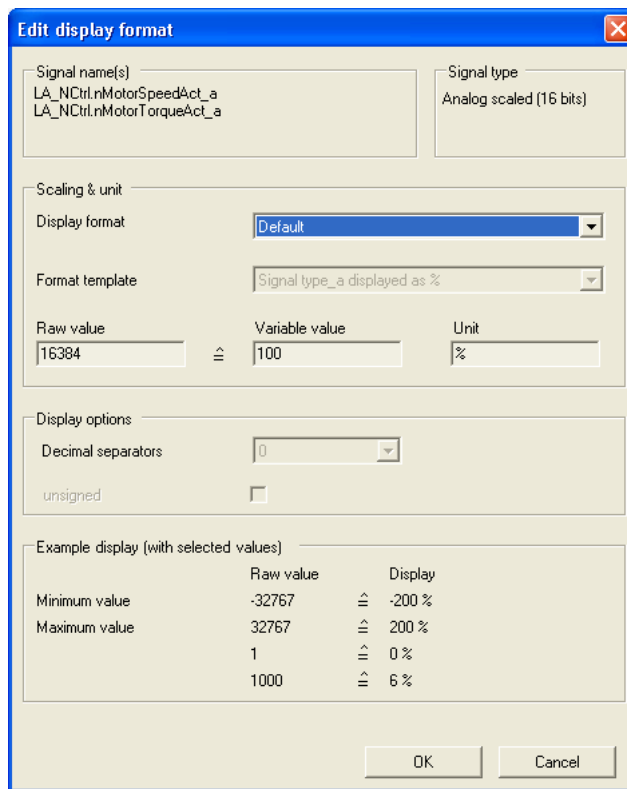

Select all inputs/outputs

Reset all format information

3. Click the  symbol to edit the display format of the selected inputs/outputs.
  - The *Edit display format* dialog box is displayed:

**Edit display format**

Signal name(s)  
 LA\_NCtrl.nMotorSpeedAct\_a  
 LA\_NCtrl.nMotorTorqueAct\_a

Signal type  
 Analog scaled (16 bits)

Scaling & unit

Display format: Default

Format template: Signal type\_a displayed as %

Raw value: 16384    Variable value: 100    Unit: %

Display options

Decimal separators: 0

unsigned: ☐

Example display (with selected values)

|               | Raw value | Display |
|---------------|-----------|---------|
| Minimum value | -32767    | -200 %  |
| Maximum value | 32767     | 200 %   |
|               | 1         | 0 %     |
|               | 1000      | 6 %     |

OK    Cancel

4. Go to the **Display format** list field and select the "User-defined" entry.
5. Go to the **Format template** list field and select "No template".
6. Select the required scaling, unit, number of decimal positions, and sign handling.
7. Click **OK** to accept the settings and close the *Edit display format* dialog box.
  - The *Display format* dialog box now displays the text "User-defined" for the changed inputs/outputs in the **Format** column.

After all required formats have been changed:

8. Click **Back** to close the *Display format* dialog box.
  - For online monitoring, the changed format is used.

## 18.4 Reconfiguring the predefined interconnection

How to proceed:

1. Insert additionally required objects into the interconnection.
2. Hide unneeded inputs/outputs of function blocks and system blocks to obtain a clearly arranged interconnection.
3. Arrange the objects in the drawing area in a reasonable manner.
4. Establish the connections required for the desired function.
5. If required, change (optimise) the processing order of the function blocks.

### Tip!

Detailed information on the individual steps can be obtained from the following subchapters!

### Note!

With the "StateLine" version, the interconnection shown in the application level cannot be edited.

### 18.4.1 Inserting/Deleting objects

Objects can be inserted in the interconnection via the *FB Editor toolbar* and the *context menu* of the drawing area. The following subchapters provide detailed information on how to insert/delete the different objects.

| Symbol  | Function  |
|---|---|
|  | <a href="#">Inserting a function block</a> (📖 1438) |
|   | <a href="#">Inserting a system block</a> (📖 1440)   |
|  | <a href="#">Insert port block</a> (📖 1442)          |
|   | <a href="#">Inserting a comment</a> (📖 1444)        |

### Tip!

Use the *context menu* of the drawing area to insert a function block, system block, port block or comment directly to the current position of the mouse pointer in the drawing area.

If you insert an object via the corresponding icon in the *FB Editor toolbar*, the object is always placed at the top left corner in the drawing area.

Interconnection elements cannot only be copied within the same interconnection but also across all devices within the same project, as long as the devices stem from the same product family. ▶ [Copying interconnection elements \(across all devices\)](#) (📖 1457)

### 18.4.1.1 Inserting a function block

#### Note!

In the FB Editor, function blocks are only available in the "Application interconnection" level!

**How to insert a function block into the interconnection:**

1. In the *FB Editor toolbar*, click the icon.
  - The *Insert Function Block* dialog box appears:
2. Unless it is already displayed, select the **Function Blocks** tab.
  - All function blocks available are displayed in the **Search results** list field.

- A preview of the selected function block is displayed.
  - A detailed description of all available function blocks can be found in the main chapter "[Function library](#)". ([1468](#))
3. If required, define **Search criteria** to narrow down the available function blocks:
    - **Block name:**  
String which must be contained in the name of the function block.
  4. After changing the search criteria, press the **Find** button to update the selection.
    - Then, only the function blocks complying with the features set in the search criteria are shown in the **Search Results** list field.
    - If no search criteria are set, all function blocks available are shown.
  5. Select the function block to be inserted in the **Search results** list field.

6. Press **Insert** button.
  - The dialog box is closed and the selected function block is inserted into the interconnection.

### Context menu for the function block

If you right-click on the header of a function block, a *context menu* opens via which you can execute the following functions in addition to the general processing functions (Copy, Insert, Delete):

| Command  | Function  |
|--|---|
|  <b>Centre</b>        | Move the visible cutout of the drawing area so that the block is centred.   |
| <b>Connector visibilities...</b>   | Define visible inputs and outputs of the block.<br>▶ <a href="#">Changing connector visibilities</a> (📖 1447)   |
| <b>Online display format...</b>  | Adapt the display format of the input and output data of the block individually for online monitoring.<br>▶ <a href="#">Change online display format</a> (📖 1435) |
|  <b>Parameters...</b> | Open the parameter list/parameterisation dialog for the block.<br>• Only if function block is parameterisable.  |
|  <b>Help</b>          | Show online help for the block.   |

### Related topics

- ▶ [Creating/deleting connections](#) (📖 1449)
- ▶ [Changing the processing order](#) (📖 1455)

### 18.4.1.2 Inserting a system block

A system block is inserted similarly to the way a function block is inserted.

**How to insert a system block into the interconnection:**

1. In the *FB Editor toolbar*, click the  icon.
  - The *Insert Function Block* dialog box appears:
2. Unless it is already displayed, select the **System Blocks** tab.
  - All system blocks available are displayed in the **Search results** list field.

- A preview of the selected function block is displayed.
3. If required, define **Search criteria** to accordingly narrow down the system blocks available:
    - **Block name:**  
String which must be contained in the name of the system block.
  4. After changing the search criteria, press the **Find** button to update the selection.
    - Then, only the system blocks complying with the features set in the search criteria are shown in the **Search Results** list field.
    - If no search criteria are set, all system blocks available are shown.

5. Select the system block to be inserted in the **Search results** list field.
6. Press **Insert** button.
  - The dialog box is closed and the selected system block is inserted into the interconnection.

### Context menu for the system block

If you right-click on the header of a system block, a *context menu* opens via which you can execute the following functions in addition to the general processing functions (Copy, Insert, Delete):

| Command   |                           | Function  |
|---|---------------------------|---|
|  | Centre                    | Move the visible cutout of the drawing area so that the block is centred.   |
|   | Connector visibilities... | Define visible inputs and outputs of the block.<br>▶ <a href="#">Changing connector visibilities</a> (📖 1447)   |
|   | Online display format...  | Adapt the display format of the input and output data of the block individually for online monitoring.<br>▶ <a href="#">Change online display format</a> (📖 1435) |
|  | Parameters...             | Open the parameter list/parameterisation dialog for the block.  |
|  | Help                      | Show online help for the block.   |

### Related topics

- ▶ [Creating/deleting connections](#) (📖 1449)

### 18.4.1.3 Insert port block

All input/output ports defined for the application on the **Ports** tab can be inserted into the interconnection in the form of port blocks in order to get access to the associated element variables.

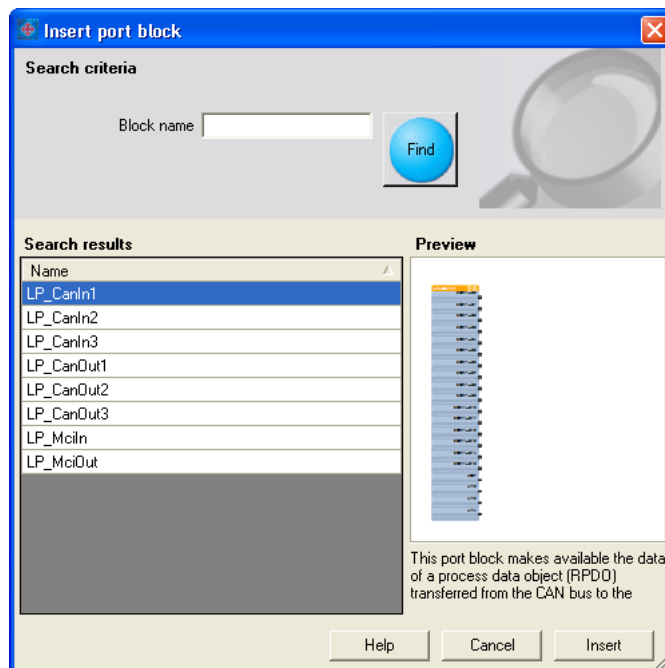

#### Tip!

You can change between the **Ports** and **FB Editor** tabs at any time to define new ports and afterwards insert them into the interconnection.

#### How to insert a port block into the interconnection:

1. In the *FB Editor toolbar*, click the  icon.
  - The *Insert port block* dialog box appears.
  - All port blocks available are displayed in the **Search results** list field.

- A preview of the selected port block is displayed.
2. If required, define **search criteria** to accordingly narrow down the port blocks available:
    - **Block name:**  
String which must be contained in the name of the port block.
  3. After changing the search criteria, press the **Find** button to update the selection.
    - Then, only the port blocks complying with the features set in the search criteria are shown in the **Search Results** list field.
    - If no search criteria are set, all port blocks available are shown.
  4. Select the port block to be inserted in the **Search results** list field.
  5. Press **Insert** button.
    - The dialog box is closed and the selected port block is inserted into the interconnection.

### Context menu for the port block

If you right-click on the header of a port block, a *context menu* opens via which you can execute the following functions in addition to the general processing functions (Copy, Insert, Delete):

| Command   | Function  |
|---|---|
|  Centre        | Move the visible cutout of the drawing area so that the block is centred.   |
| Connector visibilities...   | Define visible inputs and outputs of the block.<br>▶ <a href="#">Changing connector visibilities</a> (📘 1447)   |
| Online display format...  | Adapt the display format of the input and output data of the block individually for online monitoring.<br>▶ <a href="#">Change online display format</a> (📘 1435) |
|  Parameters... | Open the parameter list/parameterisation dialog for the block.  |
|  Help          | Show online help for the block.   |

- ▶ [Arranging objects in the drawing area](#) (📘 1448)
- ▶ [Creating/deleting connections](#) (📘 1449)

#### 18.4.1.4 Inserting a comment

Comments can be inserted at any position in the drawing area.

As of the »Engineer« V2.10, the interior colour and text alignment of a comment can be changed via a properties dialog. Now the sizes of comments can also be changed using the mouse pointer. When using different interior colours you can use comments to graphically arrange areas that belong together in terms of function or separate them from other areas:

[18-7] Example: Graphical arrangement of FBs by means of two comments that overlap.

#### Note!

The term "Arrangement" does not mean a logical arrangement of the function blocks. The comments are only graphical presentation elements of the FB Editor.

#### How to insert a new comment into the interconnection:

1. Move the mouse pointer to the (free) position in the drawing area where the comment is to be inserted.
2. Go to the *Context menu* (right mouse key) and select the **New comment** command.
  - The *Properties* dialog box is displayed:

3. Enter the required comment into the text field.
4. Optional: Change preset interior colour.
  - For this purpose, click the left **Change...** button to open the *Colour* dialog box to select another interior colour.

5. Optional: Change preset text alignment.
  - For this purpose, click the right **Change...** button to open the *Text alignment* dialog box to select another text alignment.
6. Press **OK** to close the *Properties* dialog box and insert the comment.
  - After being inserted, the corner points of the comment are shown:

7. Optional: Change size of the comment.
  - For this purpose click one of the corner points with the left mouse button and enlarge the comment to the required size with the mouse button pressed.

8. Optional: Drag comment.
  - For this purpose click the comment with the left mouse button and move the comment to the required position with the mouse button pressed.

**Tip!**

The *Properties* dialog box for a comment already available can be opened by double-clicking the comment.

- ▶ [Arranging objects in the drawing area](#) (📖 1448)
- ▶ [Creating/deleting connections](#) (📖 1449)

#### 18.4.1.5 Deleting objects that are no longer required

Objects that are no longer required can be easily deleted again. "Delete" only means that the object is removed from the drawing area. If you have deleted an object from the drawing area, you can reinsert it any time into the interconnection.

##### Note!

Deleting an object cannot be undone.

Together with the object, all available connections to this object are deleted.

##### How to delete objects that are no longer required:

1. Select objects to be deleted.
  - You can select a single object by clicking the header of the object.
  - You can select objects that are placed together by drawing a frame around these objects while keeping the mouse button pressed.
  - If you click the header of further objects while pressing **<Ctrl>**, these will be added to an already existing selection (multi-selection).
  - All selected objects are highlighted by a light green header.
2. Press **<Del>**.

##### Related topics

▶ [Deleting connections that are no longer required](#) (📖 1454)

### 18.4.2 Changing connector visibilities

Inputs and outputs that are not connected can be hidden for each block. This serves to reduce the dimension of the block. The interconnection becomes clearer.

**How to define the visible inputs and outputs:**

1. Go to the context menu of the block and select the **Connector visibilities** command.
  - The *Define Visible Inputs and Outputs for Function Blocks* is displayed:

- All visible connections have a checkmark.
  - In case of a block that is inserted anew, all inputs and outputs are visible at first.
  - Inputs and outputs with a light grey checkbox are already connected and thus cannot be hidden.
2. By setting/removing the checkmarks or via the buttons you can define the visible inputs and outputs.
  3. Press **OK** to accept the selected definition and close the dialog box.

### 18.4.3 Arranging objects in the drawing area

All objects can be freely arranged in the drawing area by dragging with the mouse.

We recommend to make an arrangement in which the required connections between the inputs and outputs can be created easily. A division into functional areas may also be sensible to get a better understanding of the application.

Objects which are already connected, can also be dragged to another (free) position in the drawing area. The available connections will be automatically re-routed after dragging.

#### How to drag an object:

1. Click the header of the object (and keep the button pressed).
2. Keep the button pressed and drag the object to the required position in the drawing area.
  - Via **<Esc>** you can cancel this action.

#### How to drag several objects at the same time:

1. Select the objects to be dragged.
  - You can select a single object by clicking the header of the object.
  - If you click the header of further objects while pressing **<Ctrl>**, these will be added to an already existing selection (multi-selection).
  - You can easily select objects that are placed together by drawing a frame around these objects while keeping the mouse button pressed.
  - All selected objects are highlighted by a light green header.
2. Keep the mouse button pressed on the header of one of the selected objects and drag it to the required position in the drawing area.
  - Via **<Esc>** you can cancel this action.

#### Note!

A red header indicates that the object overlaps with other objects in the drawing area!  
Arrange the objects so that no overlap occurs.

#### 18.4.4 Creating/deleting connections

After adding objects and arranging them in a reasonable manner within the drawing area, you can create the connections between the available objects which are required for the desired function.

A connection always has a direction and therefore always has a source and a target.

- An output represents a possible source in the interconnection.
- An input represents a possible target in the interconnection.

#### Permissible/impermissible connections

Several connections can lead from one output.

- Therefore it is always possible to start a new connection from an output.

However, maximally one connection may end in an input.

- Therefore it is only possible to start a new connection from an input if there is no connection already ending in this input.

Only inputs/outputs of the same signal type can be connected.

- Thus, a connection between different port symbol cannot be established.

From the »Engineer« V2.12 "Analog/scaled" (\_a) and "Miscellaneous (WORD)" signal types can also be interconnected.

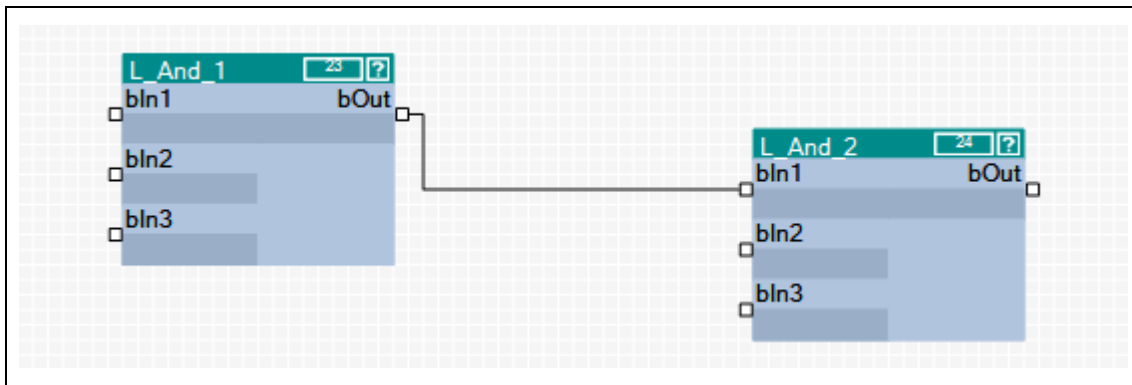

- The implicit type conversion is indicated by a vertical black bar at the port symbol.

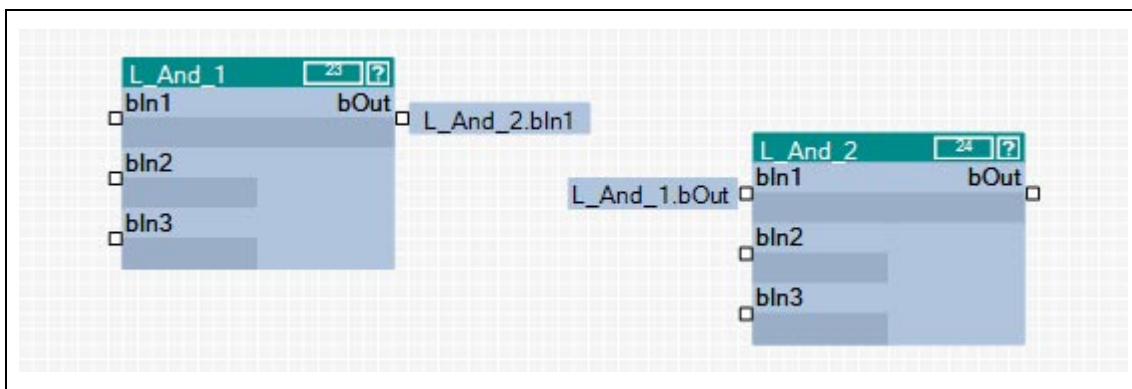

From the »Engineer« V2.13 "Analog/scaled" (\_a) and "Angular velocity" (\_v) signal types can also be interconnected.

### Connection types

Connections can either be created by means of connection lines or port identifiers ("flags")

[18-8] Example 1: Connection via connection line

[18-9] Example 2: Connection via flags

#### Tip!

The commands **Show as flag** or **Show as line** in the *context menu* of a connection serve to change the representation of the connection at any time.

When an output is connected to several inputs via flags, three points are displayed ("...") at the output instead of the concrete input identifier. The *context menu* of the port symbol shows all inputs which are connected to the output.

#### 18.4.4.1 Creating a connection using the connection line

##### How to create a connection using the connection line:

1. Click the port symbol from which the new connection is to be started.
  - It is only possible to start a new connection from an input if there is no connection already ending in this input.
  - If you then move the mouse pointer away from the port symbol, a new connection is "drawn" from this port symbol.
  - Via <Esc> you can cancel this action.
2. Click the port symbol where the connection is to end.
  - Thereupon the corresponding connection is routed automatically if the connection is permissible.

##### Tip!

If you move the mouse pointer across the port symbol while drawing a new connection, you can see whether the connection is permissible or not from the colour of the drawn line and from the mouse pointer symbol.

- Permissible connection:

- Impermissible connection (different port symbol):

The command **Show as flag** in the *context menu* of a line serves to change the representation of the connection at any time.

### 18.4.4.2 Creating a connection using port identifiers

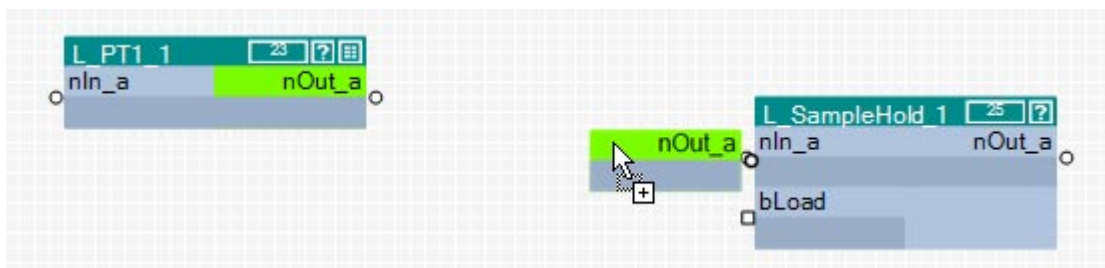

How to create a connection with port identifiers:

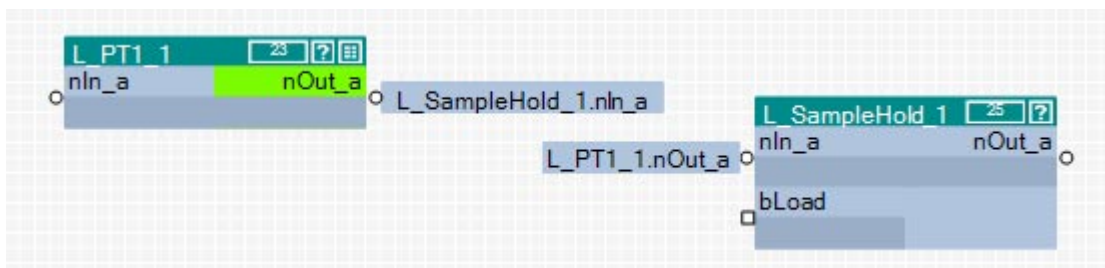

1. Click the port identifier.
  - The selected port is highlighted in light green:

2. Drag the port segment to the required port while keeping the left mouse button pressed:

After releasing the mouse button, the connection via port identifiers (flags) is created. The corresponding port identifier consists of the block name and the name of the input/output:

#### Tip!

The command **Show as line** in the *context menu* of a flag serves to change the representation of the connection at any time.

### 18.4.4.3 Creating a connection via connection dialog

You can also create connections by means of a selection dialog instead of dragging by mouse. This especially makes sense if there is a great distance between the ports to be connected in the drawing area.

#### How to create a connection using the selection dialog:

1. Right-click the port identifier or click the port symbol from which the connection is to start.
  - The *context menu* for the port is displayed.
2. Go to the *context menu* for the port and select the **Add/change connection...** command.
  - The *Add/change connection* dialog box is displayed:

- In a tree structure all inputs and outputs of the application are shown to which a connection is permissible.
  - You can enter an optional text into the **Filter** input field to reduce the selection to the blocks or ports which contain the entered text.
  - If you activate the **Show hidden ports** control field, the hidden ports for system and function blocks are shown as well.
3. Select the port where the connection is to end from the tree structure.
  4. Activate the **Add connection as flag** control field if a port identifier (flag) is to be inserted instead of a connection line.
  5. Press **OK** to create the connection to the selected port and close the dialog box.

#### 18.4.4.4 Deleting connections that are no longer required

##### How to delete connection lines:

1. Select connection lines to be deleted.
  - Select a single connection line by directly clicking on the connection line with the right mouse button.
  - If you click further connection lines while pressing **<Ctrl>** they are added to an already existing selection (multi-selection).
  - All connection lines are highlighted in red.
2. Press **<Del>**.

##### How to delete port identifiers/flags:

1. Select the port identifiers to be deleted.
  - Select a single port identifier by directly clicking on the port identifier with the left mouse button.
  - If you click further port identifiers while pressing **<Ctrl>** they are added to an already existing selection (multi-selection).
  - All selected port identifiers are highlighted by a light green header.
2. Press **<Del>**.

### 18.4.5 Changing the processing order

If you insert a function block into the interconnection, an order index is automatically assigned to this function block. By means of this order index it is defined in which order the individual function blocks are calculated at runtime.

- The first function block inserted contains the order index "1", the next function block inserted contains the order index "2", etc.
- The respective order index is displayed in the header of the function block in the rectangle after the block name.

[18-10] Example: Function blocks with order index

#### Note!

When a function block is shifted, its order index is maintained.

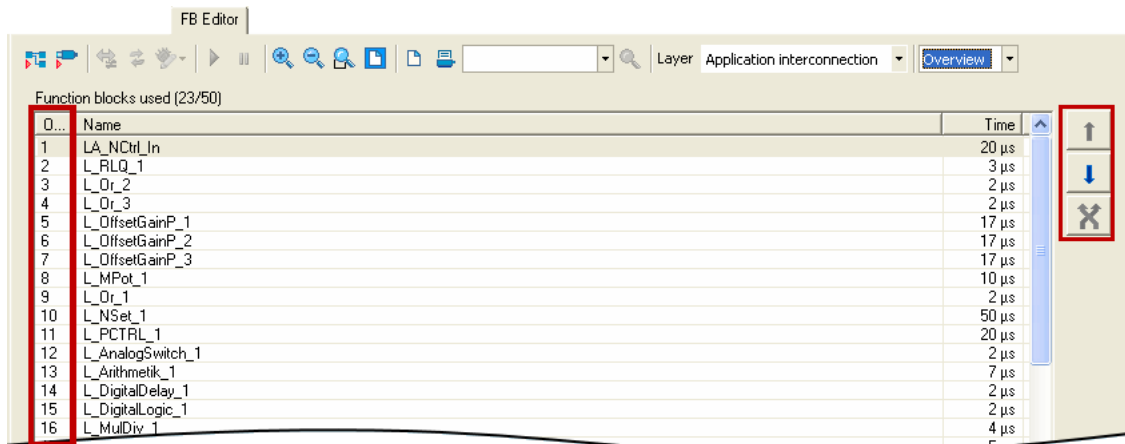

The processing order influences the result!

- In certain cases it may be sensible to change the processing order, but if you select an unfavourable processing order, errors may arise!

### How to change the processing order manually:

1. Use the list field at the top right to change from the Editor to the overview.
  - The overview displays all function blocks of the interconnection in the order of their processing
  - In the first "Order" column the order index of each function block is listed.
2. Unless already selected, select the entry "Manual selection" in the **Optimisation...** list field.

3. Select the function block which is to receive a different position within the processing order.
  - If you click further function blocks while pressing **<Ctrl>** they are added to an already existing selection (multi-selection).
  - The **<Shift>** key serves to select a related area of function blocks.
4. Move the function block(s) to the desired position using the  and  buttons.
  - The  button serves to exchange two selected function blocks with regard to their order.
5. Repeat steps 3 and 4 until the required processing order has been established.

### Changing the processing order according to an automatically generated selection

In addition to the manual selection, the **Optimisation...** list field also offers two options for an automatic adaptation of the processing order:

- **Signal flow:** The processing order is optimised according to the signal flow.
- **Topology:** The processing order is optimised according to the x/y arrangement of the function blocks in the FB Editor.

As long as an automatic adaptation has been selected, a manual change of the processing order is not possible.

### 18.4.6 Copying interconnection elements (across all devices)

Interconnection elements can be copied across the devices within the project if the devices belong to the same product family (e.g. Inverter Drives 8400).

All types of blocks and comments can be copied to the clipboard via the **Copy** command or the **<Ctrl>+<c>** shortcut and then be inserted into the FB interconnection of the same or another project device of the same product family using the **Paste** command or the **<Ctrl>+<v>** shortcut.

- During the copy process into the clipboard, existing connections between copied blocks are copied as well, and the layout is kept too. Moreover, the separate technical objects (e.g. port definition) are copied. Selected connections cannot be copied on their own.
- The **Paste** command is available if the clipboard is not empty and if it was copied from a device of the same product family. Within this product family, all device types (e.g. 8400 xxxxLine Vxx.xx) are permitted.
- After the **Paste** command has been selected, a dialog box is displayed which serves to select which elements are to be inserted from the clipboard and how to solve name conflicts, if any.
- After inserting the elements, they are marked in the target interconnection in order to be repositioned or deleted again to undo the insertion.
- Inserting from the clipboard can be repeated. The originally copied contents of the clipboard remains unchanged when it is inserted.

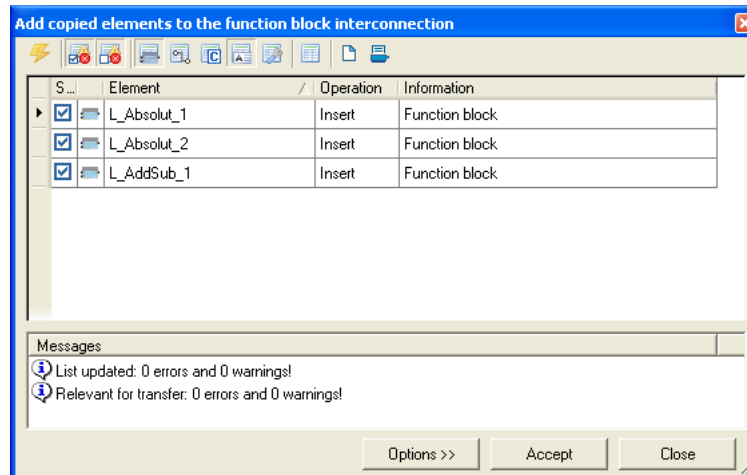

#### How to copy one or several interconnection elements:

1. Select the objects to be copied.
  - You can select a single object by clicking the header of the object.
  - If you click the header of further objects while pressing **<Ctrl>**, these will be added to an already existing selection (multi-selection).
  - You can easily select elements that are placed together by drawing a frame around these elements while keeping the mouse button pressed.
  - All selected objects are highlighted by a light green header.
2. Go to the *context menu* and select the **Copy** command (or **<Ctrl>+<c>**).
  - The selected elements are copied into the clipboard of the FB Editor.
3. If the elements are to be copied into a function block interconnection of another project device, change to the corresponding interconnection via the *project view*.
4. Go to the *context menu* and select the **Paste** command (or **<Ctrl>+<v>**).
5. Go to the *Insert FB interconnection* dialog box and select the elements to be inserted from the clipboard.
  - Detailed information on this dialog box can be obtained from the following subchapter "[Insert options for copied elements](#)". (1459)

6. Click **Insert** to insert the selected elements into the target interconnection as defined.
  - Only possible if at least one element in the list has been selected for insertion.
  - Insertion is also possible via the **<Enter>** button if at least one element is selected from the list for insertion.
  - The original layout and the relative position of the inserted blocks to each other are maintained.
  - When copying across the devices, you also insert the corresponding separate technical objects (e.g. port definition).
  - The inserted elements are deleted from the list. If the list is empty, the dialog box is closed and the connections are inserted depending on the selected option.
7. If there are still elements to be entered in the list, repeat steps 5 and 6 until all elements are inserted as intended.
8. Press **Close** to stop the insertion and close the dialog box.
  - You can also use **<Esc>** or **<Enter>** to close the dialog box if "Insert" is not active.
  - The elements inserted into the target interconnection so far are maintained.
  - The connections for the blocks inserted so far are inserted depending on the selected option.

### 18.4.6.1 Insert options for copied elements

If interconnection elements have been copied to the clipboard, the »Engineer« will display a list of all elements contained in the clipboard when selecting the command **Insert** in the *Insert FB interconnection* dialog box:

The list shows the elements which can be added to the target interconnection, and the elements which cannot be added.

- In the "Selection" column, you can check/uncheck the elements to be added.
- Connections are only inserted when the dialog box is closed, which applies to all modules inserted so far. They are displayed as lines or flags, like in the original, but re-routed.
- The symbols in the *Toolbar* serve to execute the following functions:

| Symbol | Function   |
|--------|--|
|        | Add the selected elements to the interconnection                       |
|        | Show the elements to be added but are marked with an error or warning. |
|        | Show the elements not to be added and marked with an error or warning. |
|        | Show blocks  |
|        | Show connections   |
|        | Show parameters  |
|        | Show comments  |
|        | Show system elements   |
|        | Show all   |
|        | Print Preview  |
|        | Print list   |

- The buttons serve to execute the following functions:

| Button | Function  |
|--------|---|
| Paste  | Add elements selected in the list to the target interconnection <ul style="list-style-type: none"> <li>• Only possible if at least one element in the list has been selected for insertion.</li> <li>• Insertion is also possible via the &lt;Enter&gt; button if at least one element is selected from the list for insertion.</li> <li>• The original layout and the relative position of the inserted blocks to each other are maintained.</li> <li>• When copying across the devices, you also insert the corresponding separate technical objects (e.g. port definition).</li> <li>• The added elements are simultaneously deleted from the list. The connections are added depending on the selected option.</li> </ul> |
| Close  | Close dialog box. <ul style="list-style-type: none"> <li>• You can also use &lt;Esc&gt; or &lt;Enter&gt; to close the dialog box if "Insert" is not active.</li> <li>• The elements inserted into the target interconnection so far are maintained.</li> <li>• The connections for the blocks inserted so far are inserted depending on the selected option.</li> </ul>   |

### 18.4.7 Resetting changed interconnection

If you only made changes on the I/O level, you can reset them by selecting a predefined control scheme in [C00007](#). If you have also made changes on the application level, you must first reset the changed application to a predefined application in [C00005](#).

**How to reset the application interconnection to a predefined application:**

1. Go to the **Application parameters** tab.
2. Select the required application in the **Application** list field.

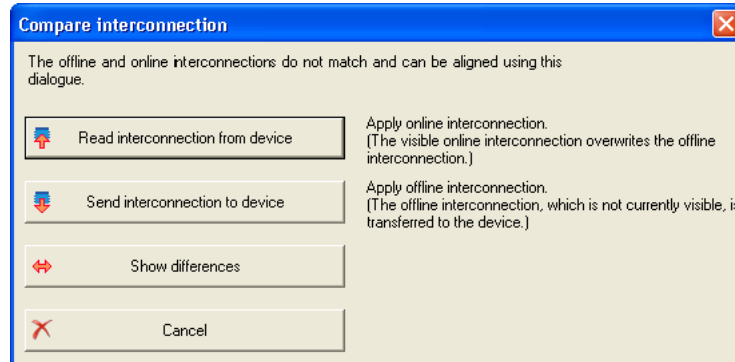

**How to reset the I/O interconnection to a predefined control scheme:**

1. Go to the **Application parameters** tab.
2. Select the required control scheme in the **Control source** list field.

## 18.5 Adjusting online and offline interconnection

If the »Engineer« detects that online and offline interconnection differ from each other, the *Compare interconnection* dialog box is displayed with various options for the adjustment:

**Tip!**

The dialog box can also be opened via the  symbol in the *FB Editor toolbar*.

| Button                                  | Function   |
|---|--|
| <b>Read interconnection from device</b> | Add the interconnection in the device to the FB Editor. The interconnection existing in the FB Editor will be overwritten by this action.  |
| <b>Send interconnection to device</b>   | Transfer the offline interconnection which is currently not visible in the FB Editor to the device. The interconnection existing in the device will be overwritten by this action. |
| <b>Show differences</b>                 | Showing differences between online and offline interconnection.  |
| <b>Cancel</b>                           | Close the <i>Adjust interconnection</i> dialog box without making an adjustment.   |

## 18.6 Printing the interconnection

The interconnection can be printed for documentation purposes, optionally on one page, on four pages, or not scaled.

### Tip!

By clicking the  icon in the *FB Editor toolbar*, you can get a print view before printing.

### How to print the interconnection:

1. In the *FB Editor toolbar*, click the  icon.
  - The *Circuit print size* dialog box is displayed.
2. Select the desired size and press **OK**.
  - The standard dialog box *Print* appears.
3. Press **OK** to start the printing process.

## 18.7 Comparing interconnections

The comparison operation serves to compare FB interconnections of 8400 devices within the project. An offline<>online comparison and the comparison of two online devices are possible.

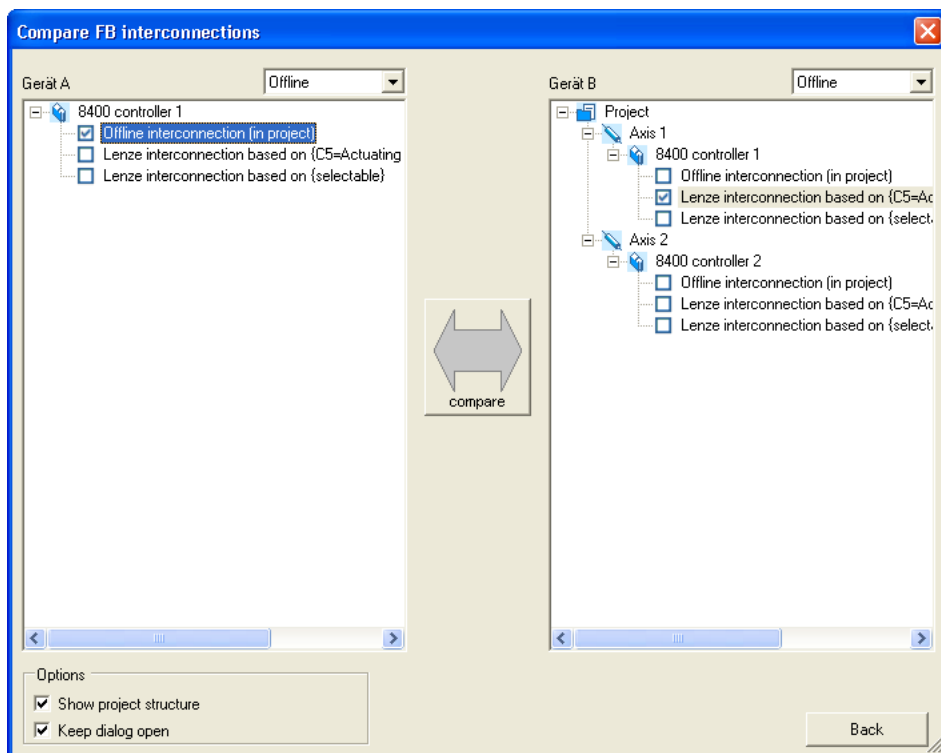

### Note!

Only applications can be compared which have been enabled in the FB Editor!  
Block positions, line representations, and connector visibilities are not compared.

### How to compare two FB interconnections:

1. Select the command **Application data→Compare FB interconnections....**
  - The *Compare FB interconnections* dialog box is displayed:

2. Select the interconnections to be compared in the project view represented on the left and right.
  - In order to execute a comparison with an online device, select "Online" in one of the two upper list fields. Then all available online devices are displayed for selection.
  - If you select "Online" in one of the two upper list fields, you can also compare the interconnections of two available online devices.
3. Click **Compare**.
  - If the comparison was executed successfully, the comparison result is displayed as a list (see the following section).
  - If a comparison of the selected interconnections is not possible, a corresponding message is displayed.
4. In order to stop the comparison operation and close the dialog box: Press **Back**.

### Representation of the comparison result

The comparison result is displayed in the form of a list in the *FB interconnection comparison* dialog box:

- The symbols in the *Toolbar* serve to show or hide different details and export and print the shown list.

| Symbol | Function  |
|--------|---|
|        | Only show differences <ul style="list-style-type: none"> <li>• Button can only be activated in expert mode.</li> </ul>                    |
|        | Show blocks   |
|        | Show connections  |
|        | Show processing sequence  |
|        | Show properties for blocks and connections <ul style="list-style-type: none"> <li>• Function is only available in expert mode.</li> </ul> |
|        | Show comments <ul style="list-style-type: none"> <li>• Function is only available in expert mode.</li> </ul>                              |
|        | Show block parameters <ul style="list-style-type: none"> <li>• Function is only available in expert mode.</li> </ul>                      |
|        | Show application parameters <ul style="list-style-type: none"> <li>• Function is only available in expert mode.</li> </ul>                |
|        | Show all <ul style="list-style-type: none"> <li>• Function is only available in expert mode.</li> </ul>                                   |
|        | Show general information  |
|        | Show summary  |

| Symbol  | Function  |
|---|---|
|  | Activate expert mode <ul style="list-style-type: none"><li>• In the expert mode, also non-functional differences are shown.</li></ul>   |
|  | Use filter <ul style="list-style-type: none"><li>• Only show list entries which contain the text entered in the input field.</li><li>• Function is only available in expert mode.</li></ul> |
|  | Export shown list as comma-separated list (*.csv)   |
|  | Print Preview   |
|  | Print list  |

## 18.8 Copying an interconnection

In contrast to copying/inserting selected interconnection elements via the clipboard, the function described in this chapter serves to replace the current FB interconnection of a device completely by the FB interconnection of another project device.

### Note!

The complete FB interconnection can only be copied between devices of the same device type and version (e.g. 8400 HighLine C V1.0).

A complete interconnection comprises:

- Function blocks (use and parameter values)
- System blocks (application and parameter values)
- Port blocks (use and parameter values)
- Connections
- Comments
- Interconnection layout (arrangement of the modules)
- Port definition of the ports used in the FB interconnection

### How to copy the complete interconnection into another project device:

1. Select the application with the FB interconnection to be copied in the *project view*.
2. Select the command **Application data→Copy FB interconnections....**
3. Go to *project view* and select the application which is to be inserted into the copied FB interconnection.
4. Select the command **Application data→Add FB interconnection....**
  - The command can only be activated if an FB interconnection has been copied from a device of the same device type and version.
  - After the command has been executed, the module assembly is compared. If there are relevant deviations, the insertion is refused and a corresponding message is displayed.
  - If an insertion is possible, you are asked if the FB interconnection is to be inserted.
5. Confirm the question if the copied FB interconnection is to be inserted with **Yes**.
  - After the insertion, an update of the project is required.

## 18.9 Exporting/Importing an interconnection

The interconnection existing in the project can be exported to a file for reuse/transfer to other devices.

### Note!

The file can only be imported to devices of the same device type and version (e.g. 8400 HighLine C V1.0).

#### How to export the interconnection from the project to a file:

1. Go to the *Project view* in the *context menu* of the inverter and select the **Export FB interconnection...** command.
2. Enter the memory location and the file name for the interconnection to be exported in the *Export FB interconnection* dialog box.
3. Click **Save** to export the interconnection and close the dialog box.

#### How to import the interconnection from a file to the project:

1. Go to the *Project view* in the *context menu* of the inverter and select the **Import FB interconnection...** command.
2. Select the file with the interconnection to be imported in the *Import FB interconnection* dialog box.
3. Click **Open** to import the interconnection and close the dialog box.

## 19 Function library

### 19.1 Function blocks

This chapter describes the function blocks which are available for the inverter in the FB Editor.

The system blocks are described in the chapter "[System blocks](#)". (1788)

#### Note!

A maximum of 75 function blocks can be used for a function block interconnection. The maximum calculating time is approx. 300  $\mu$ s.

#### Overview of function blocks available

| Function block   | Runtime   | Function   |
|--|-----------|--|
| <a href="#">L_Absolute_1</a><br><a href="#">L_Absolute_2</a>   | 2 $\mu$ s | ... converts a bipolar input signal into a unipolar output signal.   |
| <a href="#">L_AddSub_1</a>   | 3 $\mu$ s | ... adds / subtracts analog input signals.   |
| <a href="#">L_AnalogSwitch_1</a><br><a href="#">L_AnalogSwitch_2</a><br><a href="#">L_AnalogSwitch_3</a><br><a href="#">L_AnalogSwitch_4</a><br><a href="#">L_AnalogSwitch_5</a>   | 2 $\mu$ s | ... switches between two analog input signals.   |
| <a href="#">L_And_1</a><br><a href="#">L_And_2</a><br><a href="#">L_And_3</a>  | 2 $\mu$ s | ... ANDs three binary signals.   |
| <a href="#">L_And5_1</a><br><a href="#">L_And5_2</a>   | 2 $\mu$ s | ... ANDs five binary signals.  |
| <a href="#">L_Arithmetik_1</a><br><a href="#">L_Arithmetik_2</a><br><a href="#">L_Arithmetik_3</a><br><a href="#">L_Arithmetik_4</a><br><a href="#">L_Arithmetik_5</a>   | 7 $\mu$ s | ... combines two analog signals arithmetically.  |
| <a href="#">L_ArithmetikPhi_1</a><br><a href="#">L_ArithmetikPhi_2</a><br><a href="#">L_ArithmetikPhi_3</a><br><a href="#">L_ArithmetikPhi_4</a><br><a href="#">L_ArithmetikPhi_5</a><br><a href="#">L_ArithmetikPhi_6</a> | 7 $\mu$ s | ... combines two angle signals arithmetically.<br>• <a href="#">L_ArithmetikPhi_4</a> ... <a href="#">L_ArithmetikPhi_6</a> are available from version 12.00.00. |
| <a href="#">L_CalcDiameter_1</a>   | 2 $\mu$ s | ... can calculate the reel diameter from line speed and winding speed.<br>• <a href="#">This FB is available from version 02.00.00.</a>                          |
| <a href="#">L_Compare_1</a><br><a href="#">L_Compare_2</a><br><a href="#">L_Compare_3</a><br><a href="#">L_Compare_4</a><br><a href="#">L_Compare_5</a>  | 5 $\mu$ s | ... compares two analog signals and can be used e.g. to implement a trigger.   |

| Function block   | Runtime | Function   |
|--|---------|--|
| <a href="#">L_ComparePhi_1</a><br><a href="#">L_ComparePhi_2</a><br><a href="#">L_ComparePhi_3</a><br><a href="#">L_ComparePhi_4</a><br><a href="#">L_ComparePhi_5</a> | 5 µs    | ... compares two angle signals.  |
| <a href="#">L_ConvActPos_1</a>   | 0 µs    | ... filters and scales a dancer position value to an available setting range.<br>• This FB is available from version 12.00.00.   |
| <a href="#">L_ConvAP_1</a><br><a href="#">L_ConvAP_2</a><br><a href="#">L_ConvAP_3</a>   | 0 µs    | ... converts an analog value into a position.<br>• These FBs are available from version 02.00.00.  |
| <a href="#">L_ConvBitsToWorld_1</a><br><a href="#">L_ConvBitsToWorld_2</a><br><a href="#">L_ConvBitsToWorld_3</a>  | 3 µs    | ... converts 16 bit input values of the type "BOOL" into an output value of the type "WORD".   |

19.1.1 L\_Absolut\_1

This FB converts a bipolar input signal into a unipolar output signal.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn_a      | INT       | Input signal                  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

19.1.2 L\_Absolut\_2

This FB converts a bipolar input signal into a unipolar output signal.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn_a      | INT       | Input signal                  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

19.1.3 L\_AddSub\_1

This FB has two adding inputs and one subtracting input.

- The value provided at the *nOut\_a* output is internally limited to  $\pm 32767$ .

inputs

| Designator    | Data type | Information/possible settings   |
|---------------|-----------|---|
| <i>nIn1_a</i> | INT       | Input signal 1 <ul style="list-style-type: none"><li>• This input is added</li></ul>      |
| <i>nIn2_a</i> | INT       | Input signal 2 <ul style="list-style-type: none"><li>• This input is added</li></ul>      |
| <i>nIn3_a</i> | INT       | Input signal 3 <ul style="list-style-type: none"><li>• This input is subtracted</li></ul> |

outputs

| Designator    | Data type | Value/meaning   |
|---------------|-----------|---|
| <i>nOut_a</i> | INT       | Output signal <ul style="list-style-type: none"><li>• <math>nOut\_a = nIn1\_a + nIn2\_a - nIn3\_a</math></li><li>• Internal limitation to <math>\pm 32767</math> (<math>\pm 199.99 \%</math>)</li></ul> |

19.1.4 L\_AnalogSwitch\_1

This FB changes over between two analog input signals. The change-over is controlled via a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                                 |
|------------|-----------|---|
| nln1_a     | INT       | Input signal 1  |
| nln2_a     | INT       | Input signal 2  |
| bSet       | BOOL      | Selection of the input signal for the output to <i>nOut_a</i> |
|            |           | FALSE <i>nln1_a</i>   |
|            |           | TRUE <i>nln2_a</i>  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

19.1.5 L\_AnalogSwitch\_2

This FB changes over between two analog input signals. The change-over is controlled via a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                                 |
|------------|-----------|---|
| nln1_a     | INT       | Input signal 1  |
| nln2_a     | INT       | Input signal 2  |
| bSet       | BOOL      | Selection of the input signal for the output to <i>nOut_a</i> |
|            |           | FALSE <i>nln1_a</i>   |
|            |           | TRUE <i>nln2_a</i>  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

19.1.6 L\_AnalogSwitch\_3

This FB changes over between two analog input signals. The change-over is controlled via a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                                 |
|------------|-----------|---|
| nln1_a     | INT       | Input signal 1  |
| nln2_a     | INT       | Input signal 2  |
| bSet       | BOOL      | Selection of the input signal for the output to <i>nOut_a</i> |
|            |           | FALSE <i>nln1_a</i>   |
|            |           | TRUE <i>nln2_a</i>  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

19.1.7 L\_AnalogSwitch\_4

This FB changes over between two analog input signals. The change-over is controlled via a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                                 |
|------------|-----------|---|
| nln1_a     | INT       | Input signal 1  |
| nln2_a     | INT       | Input signal 2  |
| bSet       | BOOL      | Selection of the input signal for the output to <i>nOut_a</i> |
|            |           | FALSE <i>nln1_a</i>   |
|            |           | TRUE <i>nln2_a</i>  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

19.1.8 L\_AnalogSwitch\_5

This FB changes over between two analog input signals. The change-over is controlled via a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                          |
|------------|-----------|--|
| nln1_a     | INT       | Input signal 1   |
| nln2_a     | INT       | Input signal 2   |
| bSet       | BOOL      | Selection of the input signal for the output to nOut_a |
|            |           | FALSE nln1_a   |
|            |           | TRUE nln2_a  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

19.1.9 L\_And\_1

This FB implements AND operations for input signals.

inputs

| Designator           | Data type | Information/possible settings |
|----------------------|-----------|-------------------------------|
| bIn1<br>bIn2<br>bIn3 | BOOL      | Input signal                  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| bOut       | BOOL      | Output signal |

Function

| inputs |       |       | Output |
|--------|-------|-------|--------|
| bIn3   | bIn2  | bIn1  | bOut   |
| FALSE  | FALSE | FALSE | FALSE  |
| FALSE  | FALSE | TRUE  |        |
| FALSE  | TRUE  | FALSE |        |
| FALSE  | TRUE  | TRUE  |        |
| TRUE   | FALSE | FALSE |        |
| TRUE   | FALSE | TRUE  |        |
| TRUE   | TRUE  | FALSE |        |
| TRUE   | TRUE  | TRUE  | TRUE   |

[19-1] Truth table of the FB L\_And\_1

19.1.10 L\_And\_2

This FB implements AND operations for input signals.

inputs

| Designator  | Information/possible settings |
|---|-------------------------------|
| <div>bIn1</div> <div>bIn2</div> <div>bIn3</div> <div>BOOL</div> | Input signal                  |

outputs

| Designator                      | Value/meaning |
|---------------------------------|---------------|
| <div>bOut</div> <div>BOOL</div> | Output signal |

Function

| inputs |       |       | Output |
|--------|-------|-------|--------|
| bIn3   | bIn2  | bIn1  | bOut   |

[19-5] Truth table of the FB L\_And5\_2

### 19.1.14 L\_Arithmetik\_1

This FB can implement an arithmetic link between two analog signals.

- The arithmetic function is selected in [C00338](#).
- All internal intermediate results and the value output at the *nOut\_a* output are internally limited to  $\pm 32767$ .
- Division is not remainder considered.

#### inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nln1_a     | INT       | Input signal 1                |
| nln2_a     | INT       | Input signal 2                |

#### outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut_a     | INT       | Output signal<br>• Internal limitation to $\pm 32767$ ( $\pm 199.99\%$ ) |

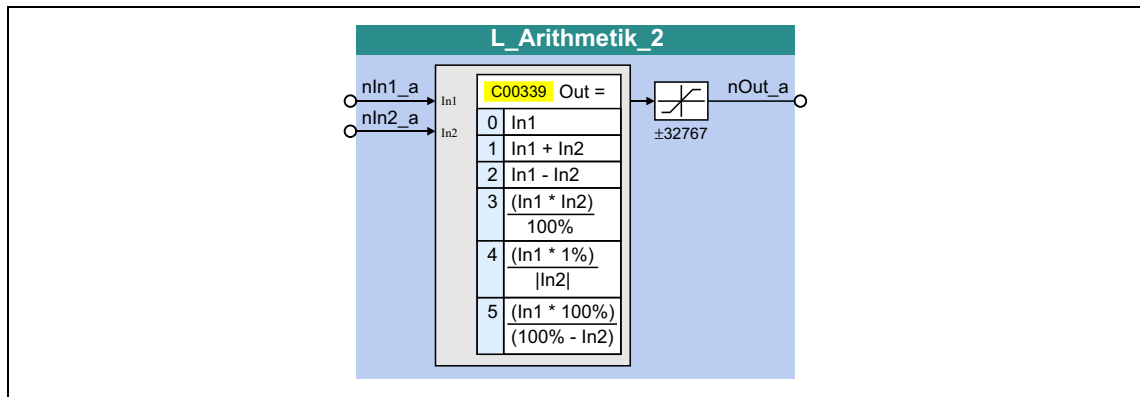

#### Parameters

| Parameters             | Possible settings   | Information  |
|------------------------|---|--|
| <a href="#">C00338</a> |   | Function selection   |
|                        | 0 $nOut\_a = nln1\_a$                                     |  |
|                        | 1 $nOut\_a = nln1\_a + nln2\_a$                           |  |
|                        | 2 $nOut\_a = nln1\_a - nln2\_a$                           |  |
|                        | 3 $nOut\_a = \frac{nln1\_a \cdot nln2\_a}{16384}$         |  |
|                        | 4 $nOut\_a = \frac{nln1\_a}{ nln2\_a } \cdot 164$         | When the denominator has the value "0", it will be set to "1". |
|                        | 5 $nOut\_a = \frac{nln1\_a}{16384 - nln2\_a} \cdot 16384$ |  |

### 19.1.15 L\_Arithmetik\_2

This FB can implement an arithmetic link between two analog signals.

- The arithmetic function is selected in [C00339](#).
- All internal intermediate results and the value output at the *nOut\_a* output are internally limited to  $\pm 32767$ .
- Division is not remainder considered.

#### inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nln1_a     | INT       | Input signal 1                |
| nln2_a     | INT       | Input signal 2                |

#### outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut_a     | INT       | Output signal<br>• Internal limitation to $\pm 32767$ ( $\pm 199.99\%$ ) |

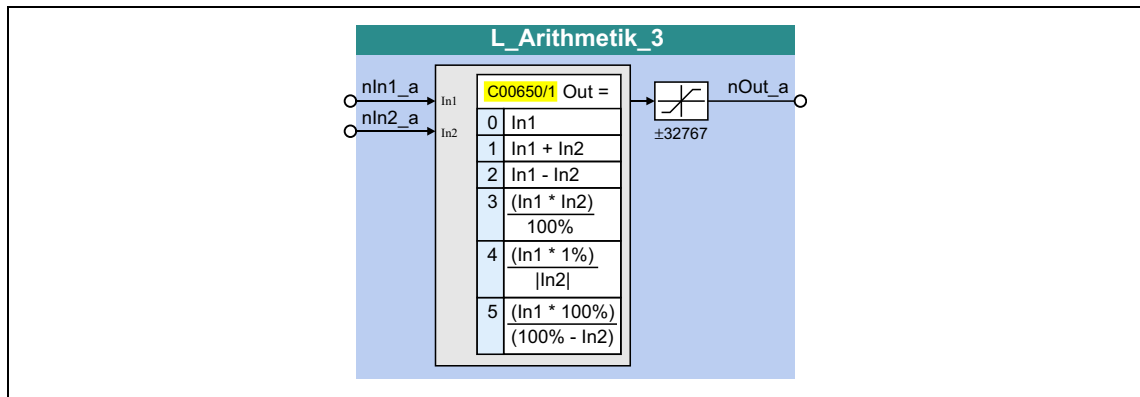

#### Parameters

| Parameters             | Possible settings   | Information  |
|------------------------|---|--|
| <a href="#">C00339</a> |   | Function selection   |
|                        | 0 $nOut\_a = nln1\_a$                                     |  |
|                        | 1 $nOut\_a = nln1\_a + nln2\_a$                           |  |
|                        | 2 $nOut\_a = nln1\_a - nln2\_a$                           |  |
|                        | 3 $nOut\_a = \frac{nln1\_a \cdot nln2\_a}{16384}$         |  |
|                        | 4 $nOut\_a = \frac{nln1\_a}{ nln2\_a } \cdot 164$         | When the denominator has the value "0", it will be set to "1". |
|                        | 5 $nOut\_a = \frac{nln1\_a}{16384 - nln2\_a} \cdot 16384$ |  |

### 19.1.16 L\_Arithmetik\_3

This FB can implement an arithmetic link between two analog signals.

- The arithmetic function is selected in [C00650/1](#).
- All internal intermediate results and the value output at the *nOut\_a* output are internally limited to  $\pm 32767$ .
- Division is not remainder considered.

#### inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nln1_a     | INT       | Input signal 1                |
| nln2_a     | INT       | Input signal 2                |

#### outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut_a     | INT       | Output signal<br>• Internal limitation to $\pm 32767$ ( $\pm 199.99\%$ ) |

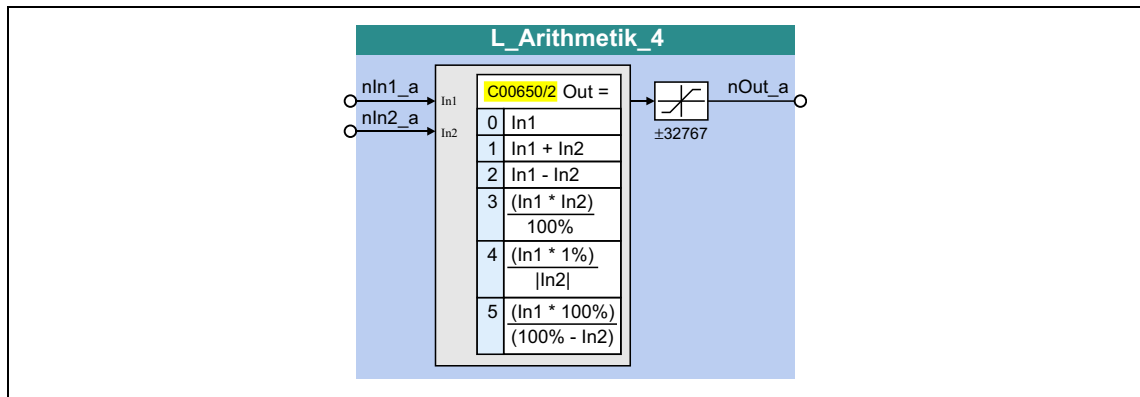

#### Parameters

| Parameters               | Possible settings   | Information  |
|--------------------------|---|--|
| <a href="#">C00650/1</a> |   | Function selection   |
|                          | 0 $nOut\_a = nln1\_a$                                     |  |
|                          | 1 $nOut\_a = nln1\_a + nln2\_a$                           |  |
|                          | 2 $nOut\_a = nln1\_a - nln2\_a$                           |  |
|                          | 3 $nOut\_a = \frac{nln1\_a \cdot nln2\_a}{16384}$         |  |
|                          | 4 $nOut\_a = \frac{nln1\_a}{ nln2\_a } \cdot 164$         | When the denominator has the value "0", it will be set to "1". |
|                          | 5 $nOut\_a = \frac{nln1\_a}{16384 - nln2\_a} \cdot 16384$ |  |

### 19.1.17 L\_Arithmetik\_4

This FB can implement an arithmetic link between two analog signals.

- The arithmetic function is selected in [C00650/2](#).
- All internal intermediate results and the value output at the *nOut\_a* output are internally limited to  $\pm 32767$ .
- Division is not remainder considered.

#### inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nln1_a     | INT       | Input signal 1                |
| nln2_a     | INT       | Input signal 2                |

#### outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut_a     | INT       | Output signal<br>• Internal limitation to $\pm 32767$ ( $\pm 199.99\%$ ) |

#### Parameters

| Parameters               | Possible settings   | Information  |
|--------------------------|---|--|
| <a href="#">C00650/2</a> |   | Function selection   |
|                          | 0 $nOut\_a = nln1\_a$                                     |  |
|                          | 1 $nOut\_a = nln1\_a + nln2\_a$                           |  |
|                          | 2 $nOut\_a = nln1\_a - nln2\_a$                           |  |
|                          | 3 $nOut\_a = \frac{nln1\_a \cdot nln2\_a}{16384}$         |  |
|                          | 4 $nOut\_a = \frac{nln1\_a}{ nln2\_a } \cdot 164$         | When the denominator has the value "0", it will be set to "1". |

19.1.23 L\_ArithmetikPhi\_5

This FB can implement an arithmetic link between two angle signals.

- The arithmetic function is selected in [C01011/2](#).
- All internal intermediate results and the value provided at the *dnOut\_p* output are internally limited to  $\pm 2147483647$  ( $\pm 2^{31} - 1$ ).
- Division is not remainder considered.

|                          | 2                 | Automatically from MCK |           |  |

**19.1.25.1 Set initial value**

An initial value or an external diameter signal can be defined at the *nSetDiameter\_a* input.

- this value is accepted if *bLoadDiameter* is set to TRUE.
- In case of acceptance, the diameter calculation will be reset and the filter for diameter calculation is loaded with the defined initial value.

**19.1.25.2 Calculate diameter**

For reel diameter calculation, the material speed and the current winding speed are integrated cyclically.

- The material speed is defined via *nLineSpeed\_a*.
- The winding speed is calculated from the *nMotorSpeedAct\_v* motor speed and the current *wGearNum/wGearDenom* gearbox factor.
- [C01050/1...2](#) can be used to define two different calculation cycles. The setting to be used is selected via *bCalcRef*.
- At the end of each integration interval, a new diameter value results from the division of the integrator values.
- An absolute value generation and smoothing via a first order low pass is carried out. The time constant of this filter can be set in [C01051/1](#). The *dwOutDiameter* output is not filtered.

**19.1.25.3 Select change direction, web break monitoring**

By setting *bUnidirect* to TRUE, you only enable one change direction for diameter calculation and simultaneously activate the web break monitoring.

- The permissible change direction can be defined via *bUnwind*.
- A recalculated value is only accepted if it exceeds the value saved last in the permissible direction.

After a web break, the diameter values calculated successively mostly run very quickly in the opposite direction.

- [C01052/1](#) serves to define the maximally permissible deviation in the opposite direction. If it is exceeded, the *bWebBreak* output is set to TRUE.
- If *bUnidirect* is set to FALSE, both change directions are enabled and the internal memory is always overwritten with the recalculated value which switches off the web break monitoring.

**19.1.25.4 Holding the current value**

By setting *bHoldD* to TRUE, you fix the diameter value *nDiameter\_a* output last.

- The diameter calculation is reset and the filter for diameter calculation is loaded with the internally held diameter value.

#### 19.1.25.5 Limit value monitoring

*wMinDiameter* and *wMaxDiameter* serve to define the limit values for the given diameter values. If they are reached/exceeded, the corresponding output (*bDMaxLimit/bDminLimit*) is set to TRUE.

- The unfiltered diameter value *dwOutDiameter* and the filtered diameter value *nDiameter\_a* are limited.
- The limit values are entered in [mm].
- The hysteresis for resetting *bDMaxLimit/bDminLimit* is permanently set to 1 % of *wMaxDiameter*.
- For parameter setting of further FBs, the value in *wMinDiameter* with regard to *wMaxDiameter* is provided via the *nDMin\_a* output.

#### 19.1.25.6 Converting diameter in 1/D

For evaluating the material speed with 1/D (speed-controlled winder), the reciprocal value of the reel diameter is provided via *nReziprDiameter\_a*.

- This value refers to the limitation value *wMinDiameter*.

#### 19.1.25.7 Physical state variables

The *dwOutDiameter* output provides the current diameter as physical quantity (1 LSB  $\equiv$  1 m).

*nNReel\_v* outputs the winding speed which results from the *nMotorSpeedAct\_v* motor speed and the current (*wGearNum/wGearDenom*) gearbox factor.

For supporting further functions (e.g. a traversing control), the winding speed is integrated additionally.

- The angle of rotation is output via *dnPos\_p*.
- By setting *bResetPos* to TRUE, the angle of rotation is reset.

19.1.26 L\_Compare\_1

This FB compares two analog signals and can be used e.g. to implement a trigger.

- Comparison operation, hysteresis and window size can be parameterised.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nln1_a     | INT       | Input signal 1                |
| nln2_a     | INT       | Input signal 2                |

outputs

| Designator | Data type | Value/meaning   |

### 19.1.26.1 Function 1: nln1 = nln2

This function compares two signals with regard to equality. It can, for instance, provide the comparison "actual speed equals setpoint speed" ( $n_{act} = n_{set}$ ).

- Use [C00682](#) to set the window within which the equality is to apply.
- Use [C00681](#) to set a hysteresis if the input signals are not stable and the output oscillates.

[19-6] Function 1: Switching performance

[19-7] Function 1: Example

#### 19.1.26.2 Function 2: $n_{ln1} > n_{ln2}$

This function serves, for instance, to implement the comparison "actual speed is higher than a limit value" ( $n_{act} > n_x$ ) for one direction of rotation.

[19-8] Function 2: Switching performance

## Functional sequence

1. If the value at *nln1\_a* exceeds the value *nln2\_a*, *bOut* changes from FALSE to TRUE.
2. Only if the signal at *nln1\_a* falls below the value of *nln2\_a - hysteresis* again, *bOut* changes back from TRUE to FALSE.

[19-9] Function 2: Example

### 19.1.26.3 Function 3: $nln1 < nln2$

This function serves, for instance, to implement the comparison "actual speed is lower than a limit value" ( $n_{act} < n_x$ ) for one direction of rotation.

[19-10] Function 3: Switching performance

#### Functional sequence

1. If the value at  $nln1\_a$  falls below the value at  $nln2\_a$ ,  $bOut$  changes from FALSE to TRUE.
2. Only if the signal at  $nln1\_a$  exceeds the value of  $nln2\_a$  - *hysteresis* again,  $bOut$  changes back from TRUE to FALSE.

[19-11] Function 3: Example

**19.1.26.4 Function 4:  $|n_{ln1}| = |n_{ln2}|$** 

This function serves to implement e.g. the comparison " $n_{act} = 0$ ". This function is similar to function 1. However, the amount is generated by the input signals before signal processing (without sign).

► [Function 1:  \$n\_{ln1} = n\_{ln2}\$](#)

**19.1.26.5 Function 5:  $|n_{ln1}| > |n_{ln2}|$** 

This function serves to implement e.g. the comparison " $|n_{act}| > |n_x|$ " irrespective of the direction of rotation. This function is similar to function 2. However, the amount is generated by the input signals before signal processing (without sign).

► [Function 2:  \$n\_{ln1} > n\_{ln2}\$](#)

**19.1.26.6 Function 6:  $|n_{ln1}| < |n_{ln2}|$** 

This function serves to implement the comparison " $|n_{act}| < |n_x|$ " independent of the direction of rotation. This function is similar to function 3. However, the amount is generated by the input signals before signal processing (without sign).

► [Function 3:  \$n\_{ln1} < n\_{ln2}\$](#)

19.1.27 L\_Compare\_2

This FB compares two analog signals and can be used e.g. to implement a trigger.

- Comparison operation, hysteresis and window size can be parameterised.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn1_a     | INT       | Input signal 1                |
| nIn2_a     | INT       | Input signal 2                |

outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bOut       | BOOL      | Status signal "Comparison statement is true"                |
|            |           | TRUE The statement of the selected comparison mode is true. |

Parameters

| Parameters             | Possible settings |                   |        | Information  |
|------------------------|-------------------|-------------------|--------|--|
| <a href="#">C00685</a> |                   |                   |        | Function selection   |
|                        | 1                 | $nIn1 = nIn2$     |        |  |
|                        | 2                 | $nIn1 > nIn2$     |        |  |
|                        | 3                 | $nIn1 < nIn2$     |        |  |
|                        | 4                 | $ nIn1  =  nIn2 $ |        |  |
|                        | 5                 | $ nIn1  >  nIn2 $ |        |  |
|                        | 6                 | $ nIn1  <  nIn2 $ |        |  |
| <a href="#">C00686</a> | 0.00              | %                 | 100.00 | Hysteresis <ul style="list-style-type: none"><li>• Lenze setting: 0.50 %</li></ul> |

For a detailed functional description see [L\\_Compare\\_1](#).

19.1.28 L\_Compare\_3

This FB compares two analog signals and can be used e.g. to implement a trigger.

- Comparison operation, hysteresis and window size can be parameterised.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nln1_a     | INT       | Input signal 1                |
| nln2_a     | INT       | Input signal 2                |

outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bOut       | BOOL      | Status signal "Comparison statement is true"                |
|            |           | TRUE The statement of the selected comparison mode is true. |

Parameters

| Parameters             | Possible settings |                   |        | Information                           |
|------------------------|-------------------|-------------------|--------|---------------------------------------|
| <a href="#">C00690</a> |                   |                   |        | Function selection                    |

For a detailed functional description see [L\\_Compare\\_1](#).

19.1.29 L\_Compare\_4

This FB compares two analog signals and can be used e.g. to implement a trigger.

- Comparison operation, hysteresis and window size can be parameterised.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn1_a     | INT       | Input signal 1                |
| nIn2_a     | INT       | Input signal 2                |

outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bOut       | BOOL      | Status signal "Comparison statement is true"                |
|            |           | TRUE The statement of the selected comparison mode is true. |

Parameters

| Parameters               | Possible settings |                   |        | Information  |
|--------------------------|-------------------|-------------------|--------|--|
| <a href="#">C00693/1</a> |                   |                   |        | Function selection   |
|                          | 1                 | $nIn1 = nIn2$     |        |  |
|                          | 2                 | $nIn1 > nIn2$     |        |  |
|                          | 3                 | $nIn1 < nIn2$     |        |  |
|                          | 4                 | $ nIn1  =  nIn2 $ |        |  |
|                          | 5                 | $ nIn1  >  nIn2 $ |        |  |
|                          | 6                 | $ nIn1  <  nIn2 $ |        |  |

For a detailed functional description see [L\\_Compare\\_1](#).

19.1.31 L\_ComparePhi\_1

This FB compares two angle signals.

- Comparison operation, hysteresis and window size can be parameterised.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| dnln1_p    | DINT      | Input signal 1                |
| dnln2_p    | DINT      | Input signal 2                |

outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bOut       | BOOL      | Status signal "Comparison statement is true"                |
|            |           | TRUE The statement of the selected comparison mode is true. |

Parameters

| Parameters               | Possible settings |                 |            | Information                            |
|--------------------------|-------------------|-----------------|------------|--|
| <a href="#">C01670/1</a> |                   |                 |            | Function selection                     |
|                          | 1                 | dnln1 = dnln2   |            |  |
|                          | 2                 | dnln1 > dnln2   |            |  |
|                          | 3                 | dnln1 < dnln2   |            |  |
|                          | 4                 | dnln1  =  dnln2 |            |  |
|                          | 5                 | dnln1  >  dnln2 |            |  |
|                          | 6                 | dnln1  <  dnln2 |            |  |
| <a href="#">C01671/1</a> | 0                 | Incr.           | 1073741824 | Hysteresis<br>• Lenze setting: 0 incr. |
| <a href="#">C01672/1</a> | 0                 | Incr.           | 1073741824 | Window<br>• Lenze setting: 0 incr.     |

### 19.1.31.1 Function 1: dnln1 = dnln2

This function compares two signals with regard to equality. It can, for instance, provide the comparison "actual speed equals setpoint speed" ( $n_{act} = n_{set}$ ).

- Use [C001672](#) to set the window within which the equality is to apply.
- Use [C001671](#) to set a hysteresis if the input signals are not stable and the output oscillates.

[19-12] Function 1: Switching performance

[19-13] Function 1: Example

### 19.1.31.2 Function 2: dnln1 > dnln2

This function serves, for instance, to implement the comparison "actual speed is higher than a limit value" ( $n_{act} > n_x$ ) for one direction of rotation.

[19-14] Function 2: Switching performance

#### Functional sequence

1. If the value at  $dnln1\_p$  exceeds the value at  $dnln2\_p$ ,  $bOut$  changes from FALSE to TRUE.
2. Only if the signal at  $dnln1\_p$  falls below the value of  $dnln2\_p - \text{hysteresis}$  again,  $bOut$  changes back from TRUE to FALSE.

[19-15] Function 2: Example

### 19.1.31.3 Function 3: dnln1 < dnln2

This function serves, for instance, to implement the comparison "actual speed is lower than a limit value" ( $n_{act} < n_x$ ) for one direction of rotation.

[19-16] Function 3: Switching performance

#### Functional sequence

1. If the value at  $dnln1\_p$  falls below the value at  $dnln2\_p$ ,  $bOut$  changes from FALSE to TRUE.
2. Only if the signal at  $dnln1\_p$  exceeds the value of  $dnln2\_p$  - *hysteresis* again,  $bOut$  changes back from TRUE to FALSE.

[19-17] Function 3: Example

**19.1.31.4 Function 4:  $|\text{dnIn1}| = |\text{dnIn2}|$** 

This function serves to implement e.g. the comparison " $n_{\text{act}} = 0$ ". This function is similar to function 1. However, the amount is generated by the input signals before signal processing (without sign).

► [Function 1:  \$\text{dnIn1} = \text{dnIn2}\$](#)

**19.1.31.5 Function 5:  $|\text{dnIn1}| > |\text{dnIn2}|$** 

This function serves to implement e.g. the comparison " $|n_{\text{act}}| > |n_x|$ " irrespective of the direction of rotation. This function is similar to function 2. However, the amount is generated by the input signals before signal processing (without sign).

► [Function 2:  \$\text{dnIn1} > \text{dnIn2}\$](#)

**19.1.31.6 Function 6:  $|\text{dnIn1}| < |\text{dnIn2}|$** 

This function serves to implement the comparison " $|n_{\text{act}}| < |n_x|$ " independent of the direction of rotation. This function is similar to function 3. However, the amount is generated by the input signals before signal processing (without sign).

► [Function 3:  \$\text{dnIn1} < \text{dnIn2}\$](#)

19.1.32 L\_ComparePhi\_2

This FB compares two angle signals.

- Comparison operation, hysteresis and window size can be parameterised.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| dnln1_p    | DINT      | Input signal 1                |
| dnln2_p    | DINT      | Input signal 2                |

outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bOut       | BOOL      | Status signal "Comparison statement is true"                |
|            |           | TRUE The statement of the selected comparison mode is true. |

Parameters

| Parameters               | Possible settings |                 |            | Information                            |
|--------------------------|-------------------|-----------------|------------|--|

## 19.1.36 L\_ConvActPos\_1

This FB serves to filter an actual dancer position value and scale it to the available setting range. The setting range is defined by parameterisable limit positions which can optionally be accepted automatically by a "teach-in" function.

## inputs

| Designator   | Data type | Information/possible settings   |
|--------------|-----------|---|
| nSetPos_a    | INT       | Current position setpoint<br>• Scaling: 16384 ≡ 100 %   |
| bWriteMaxPos | BOOL      | "Teach-In" function for the upper limit position<br>TRUE Actual position is saved as upper limit position in <a href="#">C01461/1</a> . |
| bWriteMinPos | BOOL      | "Teach-In" function for the lower limit position<br>TRUE Actual position is saved as lower limit position in <a href="#">C01461/2</a> . |
| nPosIn_a     | INT       | Actual position<br>• Scaling: 16384 ≡ 100 %   |
| wVMax        | WORD      | Maximum material speed in [0.1 m/min]<br>• Scaling: 2500 ≡ 250.0 m/min<br>• Internal limitation to 3000 m/min                           |
| nVLine_a     | INT       | Current path velocity<br>• Scaling: 16384 ≡ Maximum material speed (wVMax)  |

## outputs

| Designator     | Data type | Value/meaning   |
|----------------|-----------|---|
| nPosOut_a      | INT       | Converted actual position value<br>• Scaling:<br>16384 ≡ 100 % ≡ upper limit position ( <a href="#">C01461/1</a> )<br>-16384 ≡ -100 % ≡ lower limit position ( <a href="#">C01461/2</a> ) |
| bPosOverrange  | BOOL      | Monitoring of upper home position<br>TRUE Upper home position ( <a href="#">C01463/1</a> ) reached.   |
| bInSetPosition | BOOL      | Monitoring of setpoint<br>TRUE Setpoint nSetPos_a reached.  |

| Designator    | Data type | Value/meaning   |
|---------------|-----------|---|
| bNegOverrange | BOOL      | Monitoring of lower home position   |
|               |           | TRUE Lower home position ( <a href="#">C01463/2</a> ) reached.  |
| nVAdditive_a  | INT       | Material speed caused by the dancer motion<br>• Scaling: 16384 $\equiv$ Maximum material speed ( <i>wVMax</i> )                               |
| nVOut_a       | INT       | Current circumferential speed of the reel when the dancer hub is entered<br>• Scaling: 16384 $\equiv$ Maximum material speed ( <i>wVMax</i> ) |
| nMAdditive_a  | INT       | Additional torque for damping the dancer position control<br>• Scaling: 16384 $\equiv$ 100 %  |

### Parameters

| Parameters               | Possible settings |    |      | Information  |
|--------------------------|-------------------|----|------|--|
| <a href="#">C01460/1</a> | 0                 | ms | 1000 | TConst<br>• Time constant for filtering the actual position value.<br>• Lenze setting: 10 ms                     |
| <a href="#">C01461/1</a> |                   | %  |      | Upper limit position<br>• Lenze setting: 100.00 %  |
| <a href="#">C01461/2</a> |                   | %  |      | Lower limit position<br>• Lenze setting: -100.00 %   |
| <a href="#">C01462/1</a> |                   | mm |      | dwLength<br>• Storage volumen of the dancer (dancer hub).<br>• Lenze setting: 0 mm                               |
| <a href="#">C01463/1</a> |                   | %  |      | Upper home position<br>• Lenze setting: 90.00 %  |
| <a href="#">C01463/2</a> |                   | %  |      | Lower home position<br>• Lenze setting: -90.00 %   |
| <a href="#">C01464/1</a> |                   | %  |      | nWindowSetPos<br>• Tolerance zone for monitoring the dancer position.<br>• Lenze setting: 10.00 %                |
| <a href="#">C01465/1</a> |                   | s  |      | wDelayTime<br>• Delay time for monitoring the dancer position.<br>• Lenze setting: 0.100 s                       |
| <a href="#">C01466/1</a> |                   | ms |      | wTConstVAdd<br>• Time constant for filtering the additional speed.<br>• Lenze setting: 10 ms                     |
| <a href="#">C01467/1</a> |                   | %  |      | nDeadBand<br>• Dead band area for feedforward control torque ( <i>nMAdditive_a</i> ).<br>• Lenze setting: 1.00 % |
| <a href="#">C01468/1</a> |                   |    |      | wDamping<br>• Damping factor for feedforward control torque ( <i>nMAdditive_a</i> ).<br>• Lenze setting: 0.00    |

### 19.1.36.1 Determining limit positions

#### Option 1: Parameterising the limit positions

- Enter the actual value where the material stored in the dancer reaches its minimum length as upper limit position in [C01461/1](#).
- Enter the actual value where the material stored in the dancer reaches its maximum length as lower limit position in [C01461/2](#).
- If the dancer detection provides an inverse signal, the lower limit position can be greater than the upper limit position.

#### Option 2: Defining the limit positions using the "teach-in" function

Alternatively to the direct setting of the limit values in the two parameters mentioned above, it is possible to bring the dancer into the respective limit position and then transfer the current value into the corresponding parameter by setting *bWriteMaxPos* bzw. *bWriteMinPos* to TRUE ("teach-in" function).

### 19.1.36.2 Monitoring of the dancer position

When the actual position value *nPosIn\_a* reaches the current position setpoint *nSetPos\_a*, the *blnSetPosition* output is set to TRUE.

- A tolerance zone can be set in [C01464/1](#) for reaching the setpoint. When the actual dancer value leaves this tolerance zone, the *blnSetPosition* output will only be reset to FALSE after the delay time set in [C01465/1](#) has elapsed (switch off delayed).
- In [C01463/1](#) and [C01463/2](#), reference values for the limit position monitoring can be set. If the actual dancer value reaches the set reference value towards the limit position, the corresponding (*bPosOverrange* output or *bNegOverrange*) output is set to TRUE (switch-off delayed) after the delay time set in [C01465/1](#) has elapsed.

### 19.1.36.3 Circumferential speed of the reel

If the storage of the dancer is set in [C01462/1](#), the additional speed of the material resulting from the motion of the dancer is provided at the *nVAdditive\_a* output. When being added to the *nVLine\_a* material speed, it results in the current circumferential speed of the reel via the *nVOut\_a* output.

- The storage results from e.g. twice the distance between the two limit positions multiplied by the number of material wraps.
- The line speed is determined via *wVMax* and *nVLine\_a*.
- In order to suppress the natural "noise" of the actual value signal with regard to the effect on the additional speed, the additional speed passes through a filter. The time constant of the filter can be set in [C01466/1](#).

### 19.1.36.4 Additional torque for damping the dancer control

If the storage of the dancer is set in [C01462/1](#), an additional feedforward control torque *nMAdditive\_a* can be generated for damping the dancer control.

- The feedforward control torque is derived from the negated additional speed (double dancer speed) evaluated with the damping factor set in [C01468/1](#).
- In order to suppress the natural "noise" of the actual value signal with regard to the effect on the additional torque, the additional speed passes through a dead band component in addition to the filter. The dead band area can be set in [C01467/1](#).

19.1.37 L\_ConvAP\_1

This FB converts an analog value into a position.

inputs

| Designator | Data type | Information/possible settings           |
|------------|-----------|---|

|------------|-----------|--|
| dnOut_p    | DINT      | Output signal<br>• Internal limitation to $\pm 2^{31}-1$ (±2147483647) |

**Note!**

Conversion is remainder considered.

### 19.1.52 L\_ConvUnitsToIncr\_1

Taking into account the machine parameters, this FB converts a position value provided in the real unit of the machine into an internal 32-bit position value.

- The conversion mode has to be set in [C01294/1](#). In the Lenze setting, no conversion takes place due to compatibility reasons.
- Conversion and provision of the result to *dnOut\_p* do not take place in real time! Hence, the *bDataValid* output signalises when the conversion has been completed and the *dnOut\_p* output value is consistent for transfer to following processes.

#### inputs

| Designator          | Data type | Information/possible settings     |
|---------------------|-----------|-----------------------------------|
| wInLWord / wInHWord | WORD      | Input signal Low Word / High Word |

#### outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bDataValid | BOOL      | FALSE Conversion is active, <i>dnOut_p</i> is not valid.            |
|            |           | TRUE Conversion is completed, <i>dnOut_p</i> is valid (consistent). |
| dnOut_p    | DINT      | Result of conversion in [increments]                                |

#### Parameters

| Parameters               | Possible settings               | Information  |
|--------------------------|---------------------------------|--|
| <a href="#">C01294/1</a> |                                 | Mode: Position calculation   |
|                          | 0 dnOut_p=HW+LW                 | No conversion (Lenze setting)<br><b>Note!</b><br>If a cycle length is set in <a href="#">C01201/1</a> , a calculation is made under the following conditions: <ul style="list-style-type: none"> <li>• Position specification is higher than or equal to the cycle length.</li> <li>• Position specification is negative.</li> </ul> For a correct positioning process, wait until <i>bDataValid</i> = TRUE. |
|                          | 1 16 bits: LW=+/-32767          | <i>wInLWord</i> = ±32767 [Unit]  |
|                          | 2 16 bits: HW=+/-; LW=0..65535  | <i>wInLWord</i> = 0 ... 65535 [Unit]<br><i>wInHWord</i> = sign<br>(0 = positive; ≠0 = negative)  |
|                          | 3 32 bits: HW_LW=+/-214748_3647 | <i>wInHWord</i> and <i>wInLWord</i> = ±214748.3647 [Unit]  |

### Conversion formula for modes 1 ... 3

$$\text{dnOut\_p [incr.]} = \text{Input value [Unit]} \cdot \frac{\text{C01202/1}}{\text{C01202/2}} \cdot \frac{\text{C01203/2}}{\text{C01203/1}} \cdot \frac{65536[\text{Incr./rev.}]}{\text{C01204}}$$

[C01202/1](#): Gearbox factor (numerator)

[C01202/2](#): Gearbox factor (denominator)

[C01203/1](#): Encoder gearbox factor (numerator)

[C01203/2](#): Encoder gearbox factor (denominator)

[C01204](#): Feed constant

[19-18] Conversion formula for [Unit] → [increments]

### Example

- All gearbox factors = 1
- Feed constant = 360°/revolution

| Conversion mode<br>(C01294)   |                                  | wInHWord             | wInLWord            | Input value<br>[Unit] | dnOut_p<br>[Increments] |
|---|----------------------------------|----------------------|---------------------|-----------------------|-------------------------|

|   |                                  | 65535                | 33536               |                       |                         |
| 2   | 16 bits: HW=+/-; LW=0..65535     | Sign                 | 16-bit input value  | -33536                | -6105042                |
|   |                                  | 65535 ≡ negative     | 33536               |                       |                         |
| 3   | 32 bits: HW_LW=+/-214748_3647    | 32-bit input value** |                     | -3.2000               | -582                    |
|   |                                  | 65535                | 33536               |                       |                         |
| * Two's complement      ** Two's complement with four decimal positions |                                  |                      |                     |                       |                         |

### 19.1.53 L\_ConvUnitsToIncr\_2

Taking into account the machine parameters, this FB converts a position value provided in the real unit of the machine into an internal 32-bit position value.

- The conversion mode has to be set in [C01294/2](#). In the Lenze setting, no conversion takes place due to compatibility reasons.
- Conversion and provision of the result to *dnOut\_p* do not take place in real time! Hence, the *bDataValid* output signalises when the conversion has been completed and the *dnOut\_p* output value is consistent for transfer to following processes.

#### inputs

| Designator          | Data type | Information/possible settings     |
|---------------------|-----------|-----------------------------------|
| wInLWord / wInHWord | WORD      | Input signal Low Word / High Word |

#### outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bDataValid | BOOL      | FALSE Conversion is active, <i>dnOut_p</i> is not valid.            |
|            |           | TRUE Conversion is completed, <i>dnOut_p</i> is valid (consistent). |
| dnOut_p    | DINT      | Result of conversion in [increments]                                |

#### Parameters

| Parameters               | Possible settings               | Information  |
|--------------------------|---------------------------------|--|
| <a href="#">C01294/2</a> |                                 | Mode: Position calculation   |
|                          | 0 dnOut_p=HW+LW                 | No conversion (Lenze setting)<br><b>Note!</b><br>If a cycle length is set in <a href="#">C01201/1</a> , a calculation is made under the following conditions: <ul style="list-style-type: none"> <li>• Position specification is higher than or equal to the cycle length.</li> <li>• Position specification is negative.</li> </ul> For a correct positioning process, wait until <i>bDataValid</i> = TRUE. |
|                          | 1 16 bits: LW=+/-32767          | <i>wInLWord</i> = ±32767 [Unit]  |
|                          | 2 16 bits: HW=+/-; LW=0..65535  | <i>wInLWord</i> = 0 ... 65535 [Unit]<br><i>wInHWord</i> = sign<br>(0 = positive; ≠0 = negative)  |
|                          | 3 32 bits: HW_LW=+/-214748_3647 | <i>wInHWord</i> and <i>wInLWord</i> = ±214748.3647 [Unit]  |

For a detailed functional description see [L\\_ConvUnitsToIncr\\_1](#).

### 19.1.54 L\_ConvUnitsToIncr\_3

Taking into account the machine parameters, this FB converts a position value provided in the real unit of the machine into an internal 32-bit position value.

- The conversion mode has to be set in [C01294/3](#). In the Lenze setting, no conversion takes place due to compatibility reasons.
- Conversion and provision of the result to *dnOut\_p* do not take place in real time! Hence, the *bDataValid* output signalises when the conversion has been completed and the *dnOut\_p* output value is consistent for transfer to following processes.

#### inputs

| Designator          | Data type | Information/possible settings     |
|---------------------|-----------|-----------------------------------|
| wInLWord / wInHWord | WORD      | Input signal Low Word / High Word |

#### outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bDataValid | BOOL      | FALSE Conversion is active, <i>dnOut_p</i> is not valid.            |
|            |           | TRUE Conversion is completed, <i>dnOut_p</i> is valid (consistent). |
| dnOut_p    | DINT      | Result of conversion in [increments]                                |

#### Parameters

| Parameters               | Possible settings               | Information  |
|--------------------------|---------------------------------|--|
| <a href="#">C01294/3</a> |                                 | Mode: Position calculation   |
|                          | 0 dnOut_p=HW+LW                 | No conversion (Lenze setting)<br><b>Note!</b><br>If a cycle length is set in <a href="#">C01201/1</a> , a calculation is made under the following conditions: <ul style="list-style-type: none"> <li>• Position specification is higher than or equal to the cycle length.</li> <li>• Position specification is negative.</li> </ul> For a correct positioning process, wait until <i>bDataValid</i> = TRUE. |
|                          | 1 16 bits: LW=+/-32767          | <i>wInLWord</i> = ±32767 [Unit]  |
|                          | 2 16 bits: HW=+/-; LW=0..65535  | <i>wInLWord</i> = 0 ... 65535 [Unit]<br><i>wInHWord</i> = sign<br>(0 = positive; ≠0 = negative)  |
|                          | 3 32 bits: HW_LW=+/-214748_3647 | <i>wInHWord</i> and <i>wInLWord</i> = ±214748.3647 [Unit]  |

For a detailed functional description see [L\\_ConvUnitsToIncr\\_1](#).

19.1.55 L\_ConvW\_1

This FB serves to convert analog signal forms. The following conversions per parameter can be selected:

- Input signal is passed through without conversion
- [%] → [incr/ms]
- [incr/ms] → [%]
- Conversion via parameterisable factors

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wIn        | WORD      | Input signal                  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| wOut       | WORD      | Output signal |

Parameters

| Parameters               | Possible settings |   |       | Information                       |
|--------------------------|-------------------|---|-------|-----------------------------------|
| <a href="#">C00940/1</a> | -32767            |   | 32767 | Numerator<br>• Lenze setting: 1   |
| <a href="#">C00941/1</a> | -32767            |   | 32767 | Denominator<br>• Lenze setting: 1 |
| <a href="#">C00942/1</a> | 0                 | wOut = wIn (no conversion)  |       | Selection of the conversion       |
|                          | 1                 | [%] → [incr/ms]   |       |                                   |
|                          | 2                 | [incr/ms] → [%]   |       |                                   |
|                          | 3                 | wOut =<br>wIn[signed] * <a href="#">C00940</a> / <a href="#">C00941</a>   |       |                                   |
|                          | 4                 | wOut =<br>wIn[unsigned] * <a href="#">C00940</a> / <a href="#">C00941</a> |       |                                   |

**Conversion formula for selection 1****Note!**

Division is remainder considered.

$$wOut [incr/ms] = \frac{wIn [\%] \cdot C00011 [rpm] \cdot 65536 [incr/rev.]}{100 \% \cdot 60 [s/min] \cdot 1000 [ms/s]}$$

[19-19] Conversion formula for selection 1: [%] → [incr/ms]

**Conversion formula for selection 2**

$$wOut [\%] = \frac{wIn [incr/ms] \cdot 100 \% \cdot 60 [s/min] \cdot 1000 [ms/s]}{C00011 [rpm] \cdot 65536 [incr/rev.]}$$

[19-20] Conversion formula for selection 2: [incr/ms] → [%]

## Conversion formula for selection 3

**Note!**

In the internal processing, the double number display range is taken into account.

$$wOut = wIn \cdot \frac{C00940}{C00941}$$

[19-21] Conversion formula for selection 3: Parameterisable factors with the evaluation of the  $wIn$  input variable as signed value

Use this setting to scale analog signals (e.g.  $L\_MPot\_1.nOut\_a$  // output variable of the motor potentiometer).

**Note!**

In the internal processing, the double number display range is taken into account. This causes a one-time overflow when the analog display area is reached for the first time.

- In order to avoid this effect, you can use the e.g. the  $L\_OffsetGain\_x$  function block for scaling analog values.

Selected numerator: [C00940](#) = 4

Selected denominator: [C00941](#) = 1

- ❶ Overflow of positive number range
- ❷ Limitation to -1
- ❸ Overflow of negative number range
- ❹ Limitation to -1

[19-22] Selection 3: Example

## Conversion formula for selection 4

$$wOut = wIn \cdot \frac{C00940}{C00941}$$

[19-23] Conversion formula for selection 4: Parameterisable factors with the evaluation of the  $wIn$  input variable as unsigned value

Use this setting to scale unsigned signals (e.g. *LS\_ParFree.wC471\_1* // output variable of the free parameter [471/1](#)).

### Note!

The output value is limited to the number range and no overflow takes place.

[19-24] Selection 4: Example

## 19.1.56 L\_ConvW\_2

This FB serves to convert analog signal forms. The following conversions per parameter can be selected:

- Input signal is passed through without conversion
- [%] → [incr/ms]
- [incr/ms] → [%]
- Conversion via parameterisable factors

## inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wIn        | WORD      | Input signal                  |

## outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| wOut       | WORD      | Output signal |

## Parameters

| Parameters               | Possible settings |   |       | Information  |
|--------------------------|-------------------|---|-------|--|
| <a href="#">C00940/2</a> | -32767            |   | 32767 | Numerator <ul style="list-style-type: none"><li>• Lenze setting: 1</li></ul>   |
| <a href="#">C00941/2</a> | -32767            |   | 32767 | Denominator <ul style="list-style-type: none"><li>• Lenze setting: 1</li></ul> |
| <a href="#">C00942/2</a> | 0                 | <i>wOut</i> = <i>wIn</i> (no conversion)  |       | Selection of the conversion  |
|                          | 1                 | [%] → [incr/ms]   |       |  |
|                          | 2                 | [incr/ms] → [%]   |       |  |
|                          | 3                 | <i>wOut</i> = <i>wIn</i> [signed] * <a href="#">C00940</a> / <a href="#">C00941</a>   |       |  |
|                          | 4                 | <i>wOut</i> = <i>wIn</i> [unsigned] * <a href="#">C00940</a> / <a href="#">C00941</a> |       |  |

For conversion formulae see [L\\_ConvW\\_1](#).

### 19.1.57 L\_ConvW\_3

This FB serves to convert analog signal forms. The following conversions per parameter can be selected:

- Input signal is passed through without conversion
- [%] → [incr/ms]
- [incr/ms] → [%]
- Conversion via parameterisable factors

#### inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wIn        | WORD      | Input signal                  |

#### outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| wOut       | WORD      | Output signal |

#### Parameters

| Parameters               | Possible settings |  |       | Information  |
|--------------------------|-------------------|--|-------|--|
| <a href="#">C00940/3</a> | -32767            |  | 32767 | Numerator <ul style="list-style-type: none"><li>• Lenze setting: 1</li></ul>   |
| <a href="#">C00941/3</a> | -32767            |  | 32767 | Denominator <ul style="list-style-type: none"><li>• Lenze setting: 1</li></ul> |
| <a href="#">C00942/3</a> | 0                 | wOut = wIn (no conversion)   |       | Selection of the conversion  |
|                          | 1                 | [%] → [incr/ms]  |       |  |
|                          | 2                 | [incr/ms] → [%]  |       |  |
|                          | 3                 | wOut = wIn[signed] * <a href="#">C00940</a> / <a href="#">C00941</a>   |       |  |
|                          | 4                 | wOut = wIn[unsigned] * <a href="#">C00940</a> / <a href="#">C00941</a> |       |  |

For conversion formulae see [L\\_ConvW\\_1](#).

## 19.1.58 L\_ConvW\_4

This FB serves to convert analog signal forms. The following conversions per parameter can be selected:

- Input signal is passed through without conversion
- [%] → [incr/ms]
- [incr/ms] → [%]
- Conversion via parameterisable factors

## inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wIn        | WORD      | Input signal                  |

## outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| wOut       | WORD      | Output signal |

## Parameters

| Parameters               | Possible settings |  |       | Information  |
|--------------------------|-------------------|--|-------|--|
| <a href="#">C00940/4</a> | -32767            |  | 32767 | Numerator <ul style="list-style-type: none"><li>• Lenze setting: 1</li></ul>   |
| <a href="#">C00941/4</a> | -32767            |  | 32767 | Denominator <ul style="list-style-type: none"><li>• Lenze setting: 1</li></ul> |
| <a href="#">C00942/4</a> | 0                 | $wOut = wIn$ (no conversion)                   |       | Selection of the conversion  |
|                          | 1                 | [%] → [incr/ms]                                |       |  |
|                          | 2                 | [incr/ms] → [%]                                |       |  |
|                          | 3                 | $wOut = wIn[signed] * \frac{C00940}{C00941}$   |       |  |
|                          | 4                 | $wOut = wIn[unsigned] * \frac{C00940}{C00941}$ |       |  |

For conversion formulae see [L\\_ConvW\\_1](#).

19.1.59 L\_ConvWordsToDInt\_1

This FB converts two input values of the type "WORD" into one output value of the type "DINT".

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wInLWord   | WORD      | Input signal Low Word         |
| wInHWord   | WORD      | Input signal High Word        |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| dnOut_p    | DINT      | Output signal |

19.1.60 L\_ConvWordsToDInt\_2

This FB converts two input values of the type "WORD" into one output value of the type "DINT".

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wInLWord   | WORD      | Input signal Low Word         |
| wInHWord   | WORD      | Input signal High Word        |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| dnOut_p    | DINT      | Output signal |

19.1.61 L\_ConvWordsToDInt\_3

This FB converts two input values of the type "WORD" into one output value of the type "DINT".

inputs

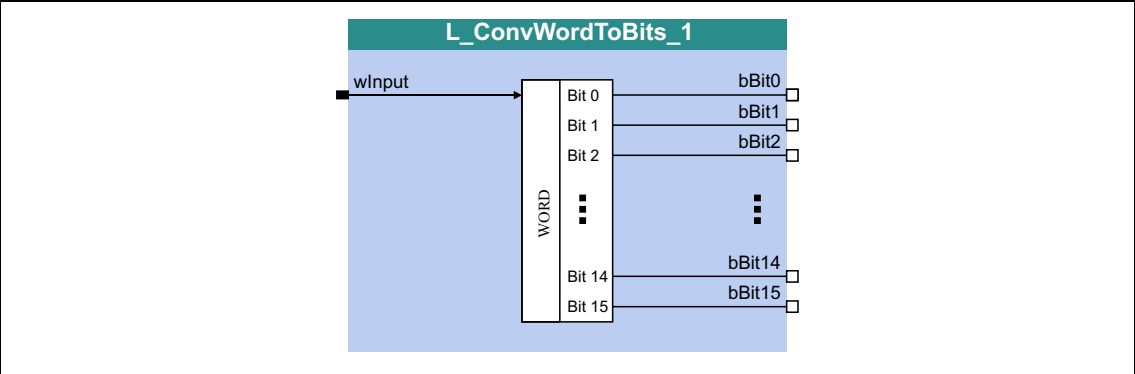

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wInLWord   | WORD      | Input signal Low Word         |
| wInHWord   | WORD      | Input signal High Word        |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| dnOut_p    | DINT      | Output signal |

19.1.62 L\_ConvWordToBits\_1

This FB converts an input value of "WORD" type into 16 individual binary signals.

inputs

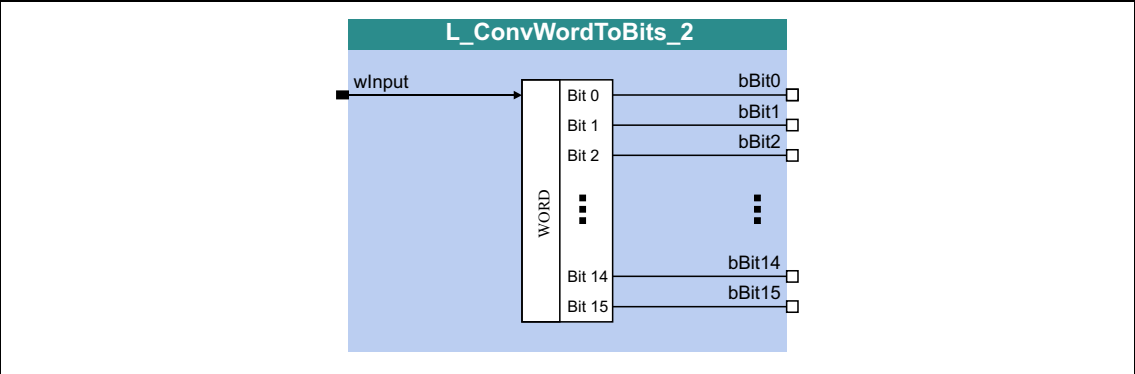

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wInput     | WORD      | Input signal                  |

outputs

| Designator             | Data type | Value/meaning |
|------------------------|-----------|---------------|
| bBit0<br>...<br>bBit15 | BOOL      | Output signal |

19.1.63 L\_ConvWordToBits\_2

This FB converts an input value of "WORD" type into 16 individual binary signals.

inputs

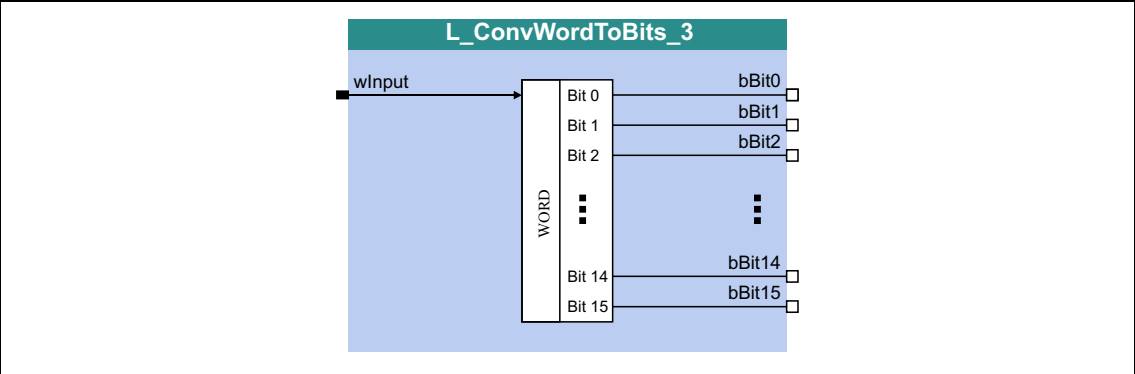

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wInput     | WORD      | Input signal                  |

outputs

| Designator             | Data type | Value/meaning |
|------------------------|-----------|---------------|
| bBit0<br>...<br>bBit15 | BOOL      | Output signal |

19.1.64 L\_ConvWordToBits\_3

This FB converts an input value of "WORD" type into 16 individual binary signals.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| wInput     | WORD      | Input signal                  |

outputs

| Designator             | Data type | Value/meaning |
|------------------------|-----------|---------------|
| bBit0<br>...<br>bBit15 | BOOL      | Output signal |

19.1.65 L\_ConvX\_1

This FB scales an analog value.

inputs

| Designator | Data type | Information/possible settings  |
|------------|-----------|--|
| nIn        | INT       | Input signal   |
| blInvers   | BOOL      | Invert sign of the output signal   |
|            |           | FALSE $nOut = nIn \cdot \frac{nNum}{wDenom}$                               |
|            |           | TRUE $nOut = nIn \cdot \frac{nNum}{wDenom} \cdot (-1)$                     |
| nNum       | INT       | Factor (numerator)<br>• Internal limitation to -32767 ... -1 / 1 ... 32767 |
| wDenom     | WORD      | Factor (denominator)<br>• Internal limitation to 1 ... 32767               |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut       | INT       | Output signal<br>• Internal limitation to ±199 % (100 % ≡ 16384) |

**Note!**

Conversion is remainder considered.

19.1.66 L\_ConvX\_2

This FB scales an analog value.

inputs

| Designator | Data type | Information/possible settings  |
|------------|-----------|--|
| nIn        | INT       | Input signal   |
| blInvers   | BOOL      | Invert sign of the output signal   |
|            |           | FALSE<br>$nOut = nIn \cdot \frac{nNum}{wDenom}$                            |
|            |           | TRUE<br>$nOut = nIn \cdot \frac{nNum}{wDenom} \cdot (-1)$                  |
| nNum       | INT       | Factor (numerator)<br>• Internal limitation to -32767 ... -1 / 1 ... 32767 |
| wDenom     | WORD      | Factor (denominator)<br>• Internal limitation to 1 ... 32767               |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut       | INT       | Output signal<br>• Internal limitation to ±199 % (100 % ≡ 16384) |

Note!

Conversion is remainder considered.

19.1.67 L\_ConvX\_3

This FB scales an analog value.

inputs

| Designator | Data type | Information/possible settings  |
|------------|-----------|--|
| nIn        | INT       | Input signal   |
| blInvers   | BOOL      | Invert sign of the output signal   |
|            |           | FALSE $nOut = nIn \cdot \frac{nNum}{wDenom}$                               |
|            |           | TRUE $nOut = nIn \cdot \frac{nNum}{wDenom} \cdot (-1)$                     |
| nNum       | INT       | Factor (numerator)<br>• Internal limitation to -32767 ... -1 / 1 ... 32767 |
| wDenom     | WORD      | Factor (denominator)<br>• Internal limitation to 1 ... 32767               |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut       | INT       | Output signal<br>• Internal limitation to ±199 % (100 % ≡ 16384) |

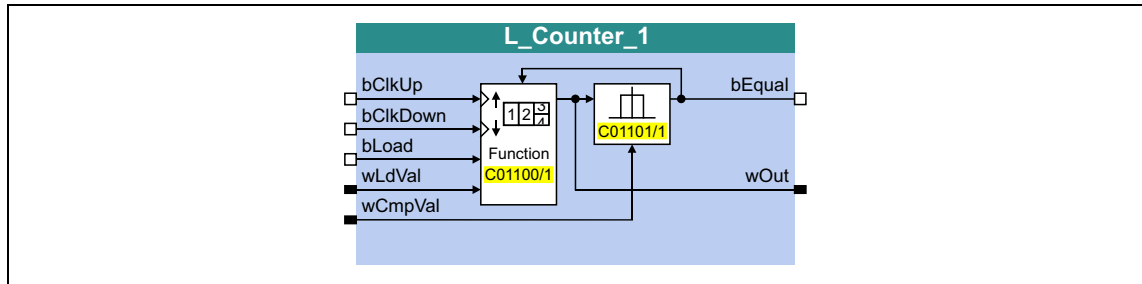

Note!

Conversion is remainder considered.

### 19.1.68 L\_Counter\_1

This FB is a digital upcounter and downcounter with a parameterisable comparison operation.

#### inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bClkUp     | BOOL      | Clock input <ul style="list-style-type: none"> <li>With each edge, the module counts up by "1".</li> <li>Only FALSE-TRUE edges are evaluated.</li> </ul> Note: The static state "1" is not permissible at this input.   |
| bClkDown   | BOOL      | Clock input <ul style="list-style-type: none"> <li>With each edge, the module counts down by "1".</li> <li>Only FALSE-TRUE edges are evaluated.</li> </ul> Note: The static state "1" is not permissible at this input. |
| bLoad      | BOOL      | Load input <ul style="list-style-type: none"> <li>The input has the highest priority.</li> </ul>  |
| wLdVal     | WORD      | Starting value <ul style="list-style-type: none"> <li>Assigned value is internally interpreted as "INT" data type (-32767 ... +32767), i.e. the most significant bit determines the sign.</li> </ul>                    |
| wCmpVal    | WORD      | Comparison value <ul style="list-style-type: none"> <li>Assigned value is internally interpreted as "INT" data type (-32767 ... +32767), i.e. the most significant bit determines the sign.</li> </ul>                  |

#### outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bEqual     | BOOL      | Status signal "Comparison statement is true" <ul style="list-style-type: none"> <li>The TRUE output is active in the Lenze setting if the current counter content is greater than or equal to the comparison value <i>wCmpVal</i>.</li> </ul> |
| wOut       | WORD      | Counter content <ul style="list-style-type: none"> <li>Internal limitation to <math>\pm 32767</math></li> <li>The most significant bit determines the sign!</li> </ul>  |

#### Parameters

| Parameters               | Possible settings |                 | Information   |
|--------------------------|-------------------|-----------------|---|
| <a href="#">C01100/1</a> |                   |                 | Function selection <ul style="list-style-type: none"><li>• Lenze setting: Normal counting</li></ul> |
|                          | 0                 | Normal counting |   |
|                          | 1                 | Auto reset      |   |
|                          | 2                 | Manual reset    |   |

| Parameters               | Possible settings                         | Information   |
|--------------------------|---|---|
| <a href="#">C01101/1</a> |   | Selection of comparison operation<br>• Lenze setting: Counter content $\geq$ comparison value |
|                          | 0 Counter content $\geq$ comparison value |   |
|                          | 1 Counter content $\leq$ comparison value |   |
|                          | 2 Counter content = comparison value      |   |

#### General function

- Every FALSE/TRUE edge at the *bClkUp* input causes the block to count upwards by "1".
- Every FALSE/TRUE edge at the *bClkDown* input causes the block to count downwards by "1".

#### Function "Normal counting"

If the statement of the comparison mode selected in [C01101/1](#) is true, the *bCompare* output is set to TRUE.

#### Function "Auto reset"

If the statement of the comparison mode selected in [C01101/1](#) is true, the *bCompare* output is set to TRUE for 1 ms and the counter is reset to the *wLdVal* starting value.

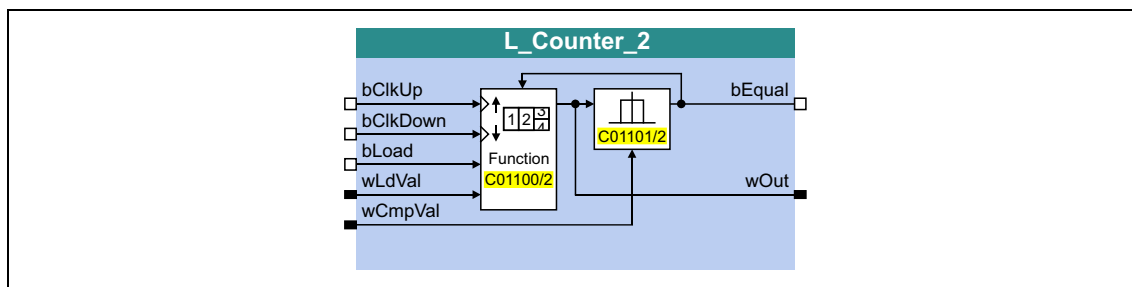

#### Function "Manual reset"

If the statement of the comparison mode selected in [C01101/1](#) is true, the *bCompare* output is set to TRUE and the counter stops.

- Edges at *bClkUp* and *bClkDown* are ignored.
- The counter must be reset via the *bLoad* input.

## 19.1.69 L\_Counter\_2

This FB is a digital upcounter and downcounter with a parameterisable comparison operation.

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bClkUp     | BOOL      | Clock input <ul style="list-style-type: none"> <li>With each edge, the module counts up by "1".</li> <li>Only FALSE-TRUE edges are evaluated.</li> </ul> Note: The static state "1" is not permissible at this input.   |
| bClkDown   | BOOL      | Clock input <ul style="list-style-type: none"> <li>With each edge, the module counts down by "1".</li> <li>Only FALSE-TRUE edges are evaluated.</li> </ul> Note: The static state "1" is not permissible at this input. |
| bLoad      | BOOL      | Load input <ul style="list-style-type: none"> <li>The input has the highest priority.</li> </ul> <div>TRUE   Accept starting value <i>wLdVal</i>.</div>   |
| wLdVal     | WORD      | Starting value <ul style="list-style-type: none"> <li>Assigned value is internally interpreted as "INT" data type (-32767 ... +32767), i.e. the most significant bit determines the sign.</li> </ul>                    |
| wCmpVal    | WORD      | Comparison value <ul style="list-style-type: none"> <li>Assigned value is internally interpreted as "INT" data type (-32767 ... +32767), i.e. the most significant bit determines the sign.</li> </ul>                  |

## outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| bEqual     | BOOL      | Status signal "Comparison statement is true" <ul style="list-style-type: none"> <li>The TRUE output is active in the Lenze setting if the current counter content is greater than or equal to the comparison value <i>wCmpVal</i>.</li> </ul> <div>TRUE   The statement of the comparison mode selected in <a href="#">C01101/2</a> is true.</div> |
| wOut       | WORD      | Counter content <ul style="list-style-type: none"> <li>Internal limitation to <math>\pm 32767</math></li> <li>The most significant bit determines the sign!</li> </ul>   |

## Parameters

| Parameters               | Possible settings                         | Information   |
|--------------------------|---|---|
| <a href="#">C01100/2</a> |   | Function selection<br>• Lenze setting: Normal counting  |
|                          | 0 Normal counting                         |   |
|                          | 1 Auto reset                              |   |
|                          | 2 Manual reset                            |   |
| <a href="#">C01101/2</a> |   | Selection of comparison operation<br>• Lenze setting: Counter content $\geq$ comparison value |
|                          | 0 Counter content $\geq$ comparison value |   |
|                          | 1 Counter content $\leq$ comparison value |   |
|                          | 2 Counter content = comparison value      |   |

## General function

- Every FALSE/TRUE edge at the *bClkUp* input causes the block to count upwards by "1".
- Every FALSE/TRUE edge at the *bClkDown* input causes the block to count downwards by "1".

## Function "Normal counting"

If the statement of the comparison mode selected in [C01101/2](#) is true, the *bCompare* output is set to TRUE.

## Function "Auto reset"

If the statement of the comparison mode selected in [C01101/2](#) is true, the *bCompare* output is set to TRUE for 1 ms and the counter is reset to the *wLdVal* starting value.

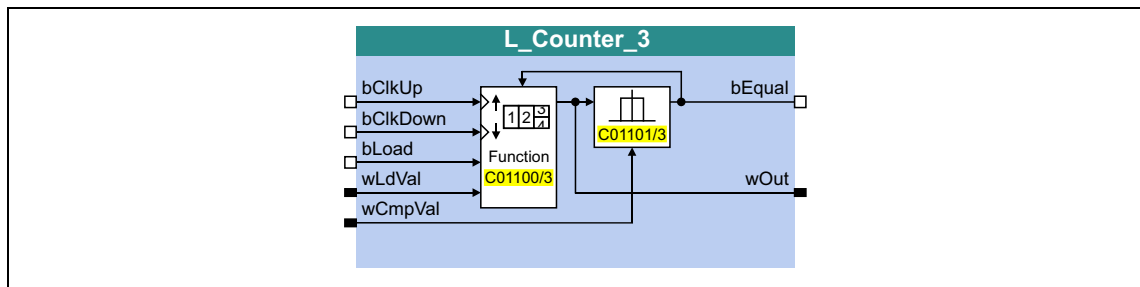

## Function "Manual reset"

If the statement of the comparison mode selected in [C01101/2](#) is true, the *bCompare* output is set to TRUE and the counter stops.

- Edges at *bClkUp* and *bClkDown* are ignored.
- The counter must be reset via the *bLoad* input.

## 19.1.70 L\_Counter\_3

This FB is a digital upcounter and downcounter with a parameterisable comparison operation.

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bClkUp     | BOOL      | Clock input <ul style="list-style-type: none"> <li>With each edge, the module counts up by "1".</li> <li>Only FALSE-TRUE edges are evaluated.</li> </ul> Note: The static state "1" is not permissible at this input.   |
| bClkDown   | BOOL      | Clock input <ul style="list-style-type: none"> <li>With each edge, the module counts down by "1".</li> <li>Only FALSE-TRUE edges are evaluated.</li> </ul> Note: The static state "1" is not permissible at this input. |
| bLoad      | BOOL      | Load input <ul style="list-style-type: none"> <li>The input has the highest priority.</li> </ul>  |
| wLdVal     | WORD      | Starting value <ul style="list-style-type: none"> <li>Assigned value is internally interpreted as "INT" data type (-32767 ... +32767), i.e. the most significant bit determines the sign.</li> </ul>                    |
| wCmpVal    | WORD      | Comparison value <ul style="list-style-type: none"> <li>Assigned value is internally interpreted as "INT" data type (-32767 ... +32767), i.e. the most significant bit determines the sign.</li> </ul>                  |

## outputs

## Parameters

| Parameters               | Possible settings                         | Information   |
|--------------------------|---|---|
| <a href="#">C01100/3</a> |   | Function selection<br>• Lenze setting: Normal counting  |
|                          | 0 Normal counting                         |   |
|                          | 1 Auto reset                              |   |
|                          | 2 Manual reset                            |   |
| <a href="#">C01101/3</a> |   | Selection of comparison operation<br>• Lenze setting: Counter content $\geq$ comparison value |
|                          | 0 Counter content $\geq$ comparison value |   |
|                          | 1 Counter content $\leq$ comparison value |   |
|                          | 2 Counter content = comparison value      |   |

## General function

- Every FALSE/TRUE edge at the *bClkUp* input causes the block to count upwards by "1".
- Every FALSE/TRUE edge at the *bClkDown* input causes the block to count downwards by "1".

## Function "Normal counting"

If the statement of the comparison mode selected in [C01101/3](#) is true, the *bCompare* output is set to TRUE.

## Function "Auto reset"

If the statement of the comparison mode selected in [C01101/3](#) is true, the *bCompare* output is set to TRUE for 1 ms and the counter is reset to the *wLdVal* starting value.

## Function "Manual reset"

If the statement of the comparison mode selected in [C01101/3](#) is true, the *bCompare* output is set to TRUE and the counter stops.

- Edges at *bClkUp* and *bClkDown* are ignored.
- The counter must be reset via the *bLoad* input.

## 19.1.71 L\_Curve\_1

Alternatively, this FB represents a characteristic curve or cam function  $y=f(x)$ , whereby the input signal of the X-axis and the output signal of the Y-axis correspond.

- A limitation of the input value can be set in [C00961/1](#) (upper limit) and [C00961/2](#) (lower limit).
- The output value is internally limited to  $\pm 199.99\%$ . If a limitation of the output value is active, *bLimit* is set to TRUE.

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nIn_a      | INT       | Input value (x) <ul style="list-style-type: none"> <li>• <math>\pm 16384 \equiv \pm 100\%</math></li> <li>• A limitation of the input value can be set in C00961/1 (upper limit) and C00961/2 (lower limit).</li> </ul> |

## outputs

| <a href="#">C00964/1...32</a> | -32767            |  | 32767 | Y values for characteristic function <ul style="list-style-type: none"> <li>• Subcodes 1 ... 32 correspond to interpolation point values Y1 ... Y32.</li> <li>• <math>\pm 16384 \equiv \pm 100\%</math></li> <li>• Lenze setting: 0</li> <li>► <a href="#">Function 3: nOut_a = f(table)</a></li> </ul> |

### 19.1.71.1 Function 3: nOut\_a = f(table)

If function 3 has been selected in [C00960](#), the output value is calculated according to a characteristic.

- The characteristic may comprise up to 32 interpolation points which are defined by parameters.
- If the *nIn\_a* input value is equal to one of the X interpolation points, the corresponding Y interpolation point will be output to *nOut\_a*.
- If the *nIn\_a* input value lies between two X interpolation points, the *nOut\_a* output value will be interpolated linearly:

[19-25] Linear interpolation between two interpolation points

### Selection of the characteristic

The max. 32 interpolation points of the characteristic are selected via the subcodes of [C00963](#) and [C00964](#).

- The values are to be set as raw values ( $\pm 16384 \equiv \pm 100\%$ ).
- The same subcodes of [C00963](#) and [C00964](#) correspond to one pair of variates/interpolation point ( $x_n, y_n$ ).

|   | 1        | 2        | ...        | 32        |
|---|----------|----------|------------|-----------|
| X | C00963/1 | C00963/2 | C00963/... | C00963/32 |
| Y | C00964/1 | C00964/2 | C00964/... | C00964/32 |

- The first pair of variates ([C00963/1](#) and [C00964/1](#)) is always valid.
- The X values of the characteristic must be entered in ascending order ( $X_1 < X_2 < \dots < X_{32}$ ).
- An interruption of the ascending order of the X values represents the end of the characteristic (in our example:  $X_5 < X_4$ ):

|   | 1                  | 2                 | 3                | 4                | 5 | 6 | 7 | ... | 32 |
|---|--------------------|-------------------|------------------|------------------|---|---|---|-----|----|
| X | -22938<br>(-140 %) | -14746<br>(-90 %) | 11469<br>(70 %)  | 23757<br>(145 %) | 0 | 0 | 0 | 0   | 0  |
| Y | -22938<br>(-140 %) | -6554<br>(-40 %)  | 18842<br>(115 %) | 26215<br>(160 %) | 0 | 0 | 0 | 0   | 0  |

- Starting at the last valid pairs of variates, extrapolation is performed on both sides until the end of the X value range ( $\pm 199.99\%$ ).

### Special cases

- Step changes/discontinuities can be displayed by using the same parameter setting for two consecutive X values. A step change is only valid if it has a valid pair of variates. Otherwise, extrapolation continues, starting at the last valid pair of variates.

|   | 1                  | 2                 | 3                 | 4                | 5 | 6 | 7 | ... | 32 |
|---|--------------------|-------------------|-------------------|------------------|---|---|---|-----|----|
| X | -21300<br>(-130 %) | -11469<br>(-70 %) | -11469<br>(-70 %) | 13107<br>(80 %)  | 0 | 0 | 0 | 0   | 0  |
| Y | -24576<br>(-150 %) | -12288<br>(-75 %) | 13927<br>(85 %)   | 26215<br>(160 %) | 0 | 0 | 0 | 0   | 0  |

[19-26] Example: Characteristic with step change

- If only one interpolation point, X1, in the negative range is defined, X2 exists with the "0" Lenze setting being the valid interpolation point ( $X2 > X1$ ), and a line is drawn through both interpolation points:

|   | 1                  | 2          | 3 | 4 | 5 | 6 | 7 | ... | 32 |
|---|--------------------|------------|---|---|---|---|---|-----|----|
| X | -21300<br>(-130 %) | 0<br>(0 %) | 0 | 0 | 0 | 0 | 0 | 0   | 0  |
| Y | 6554<br>(40 %)     | 0<br>(0 %) | 0 | 0 | 0 | 0 | 0 | 0   | 0  |

[19-27] Example: Characteristic with only one defined interpolation point and  $X1 < 0$

- If only one interpolation point, X1, is defined in the positive range, a line is extrapolated:

|   | 1                | 2 | 3 | 4 | 5 | 6 | 7 | ... | 32 |
|---|------------------|---|---|---|---|---|---|-----|----|
| X | 19661<br>(120 %) | 0 | 0 | 0 | 0 | 0 | 0 | 0   | 0  |
| Y | 6554<br>(40 %)   | 0 | 0 | 0 | 0 | 0 | 0 | 0   | 0  |

[19-28] Example: Characteristic with only one defined interpolation point and  $X1 > 0$

## 19.1.72 L\_Curve\_2

Alternatively, this FB represents a characteristic curve or cam function  $y=f(x)$ , whereby the input signal of the X-axis and the output signal of the Y-axis correspond.

- A limitation of the input value can be set in [C01026/1](#) (upper limit) and [C01026/2](#) (lower limit).
- The output value is internally limited to  $\pm 199.99\%$ . If a limitation of the output value is active, *bLimit* is set to TRUE.

## inputs

## 19.1.73 L\_Curve\_3

Alternatively, this FB represents a characteristic curve or cam function  $y=f(x)$ , whereby the input signal of the X-axis and the output signal of the Y-axis correspond.

- A limitation of the input value can be set in [C01031/1](#) (upper limit) and [C01031/2](#) (lower limit).
- The output value is internally limited to  $\pm 199.99\%$ . If a limitation of the output value is active, *bLimit* is set to TRUE.

**Tip!**

From version 12.00.00 onwards the FB **L\_Curve\_3** can be used to create a tensile force depending on the diameter for winding applications. For this purpose, the FB has been extended by further inputs/outputs and parameters.

► [Use of the L\\_Curve\\_3 for tensile force characteristic](#)

**inputs**

| Designator  | Data type | Information/possible settings   |
|---|-----------|---|
| nIn_a   | INT       | Input value (x) <ul style="list-style-type: none"> <li>• <math>\pm 16384 \equiv \pm 100\%</math></li> <li>• A limitation of the input value can be set in C01031/1 (upper limit) and C01031/2 (lower limit).</li> </ul>   |
| When using the FB for tensile force characteristic (from V12.00.00):<br>Maximum tensile force setpoint in [%] |           |   |
| The following inputs are only relevant when the FB is used for tensile force characteristic:                  |           |   |
| nCurveCtrl_a  | INT       | Slope of the characteristic (torque characteristic) in [%] <ul style="list-style-type: none"> <li>• <math>\pm 16384 \equiv \pm 100\%</math></li> <li>• Internal limitation to -100 ... +200 %</li> <li>• With 100 %, there is a constant tensile force curve and thus a torque proportionally rising with D.</li> </ul> |

|  | 2 Tensile force profile according to characteristic |   |

### 19.1.73.1 Use of the L\_Curve\_3 for tensile force characteristic

In case of centre winders, the drive torque is transmitted from the centre via the individual layers up to the winder surface. In case of smooth materials and high diameter areas, it is mostly required to reduce the tensile force depending on the diameter.

The FB **L\_Curve\_3** can be used to generate a tensile force profile depending on the diameter. For this purpose, the selection "4: Out = f(characteristic)" has to be set in [C01030/1](#).

The characteristic is marked by an initial range with constant evaluation (100 %) and a second range where the tensile force is adapted to the diameter.

The part of the characteristic that depends on the diameter can be generated for a linear tensile force profile, a linear torque profile or based on a specified characteristic. The respective selection is made in [C01035/1](#).

#### Linear tensile force profile

- *nD0\_a* serves to define at which diameter the tensile force decrease is to start.

## Linear torque profile

- $nD0\_a$  serves to define at which diameter the tensile force decrease is to start.
- Since in this characteristic selection, the linear torque profile is in the focus, define in this case the slope of the torque curve via  $dnCurveCtrl\_n$ :
  - When  $nCurveCtrl\_a = 100\%$ , the tensile force remains unchanged.
  - When  $nCurveCtrl\_a = 0\%$ , the tensile force is reduced up to  $D0/DMax$ .

### Tensile force profile according to characteristic

The characteristic (A) can be parameterised in [C01033/1...32](#).

- The characteristic comprises 32 values, regularly distributed over the diameter range of D0 ... DMax.
- The values are to be set as raw values ( $\pm 16384 \equiv \pm 100\%$ ).

- $nD0\_a$  serves to define the start of the table range (D0).
- $nCurveCtrl\_a$  serves to change the slope of the characteristic.
  - When  $nCurveCtrl\_a = 0\%$ , the slope of the characteristic remains unchanged.

19.1.74 L\_DFlipFlop\_1

The FB saves binary signals (DFlipFlop) in a clock-controlled way.

inputs

| Designator | Data type | Information/possible settings  |
|------------|-----------|--|
| bD         | BOOL      | Data input   |
| bClk       | BOOL      | Clock input <ul style="list-style-type: none"><li>Only FALSE/TRUE edges are evaluated</li></ul>  |
| bClr       | BOOL      | Reset input  |
|            |           | TRUE <ul style="list-style-type: none"><li>The <i>bOut</i> output is set to FALSE.</li><li>The <i>bNegOut</i> output is set to TRUE.</li></ul> |

outputs

| Designator | Data type | Value/meaning           |
|------------|-----------|-------------------------|
| bOut       | BOOL      | Output signal           |
| bNegOut    | BOOL      | Output signal, inverted |

Function

If the *bClr* input = FALSE, a signal edge at the *bClk* input switches the static input signal *bD* to the *bOut* output, where it is retained:

If the *bClr* input = TRUE:

- Due to the priority *bClr* > *bClk*, *bD* the *bOut* output signal can be set any time to the *FALSE* status by the *bClr* input signal = TRUE.
- The output signal is kept in this status independent of the other input signals.

### 19.1.75 L\_DFlipFlop\_2

The FB saves binary signals (DFlipFlop) in a clock-controlled way.

#### inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bD         | BOOL      | Data input  |
| bClk       | BOOL      | Clock input<br>• Only FALSE/TRUE edges are evaluated  |
| bClr       | BOOL      | Reset input   |
|            |           | TRUE <ul style="list-style-type: none"> <li>• The <i>bOut</i> output is set to FALSE.</li> <li>• The <i>bNegOut</i> output is set to TRUE.</li> </ul> |

#### outputs

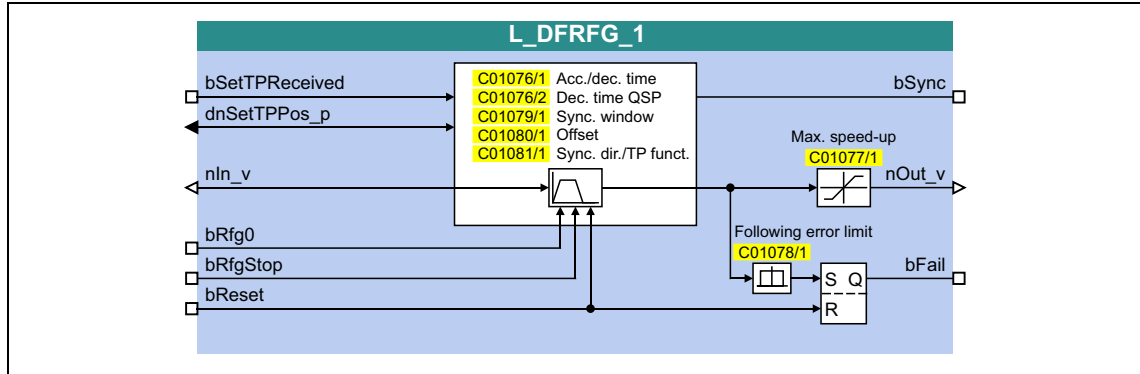

| Designator | Data type | Value/meaning           |
|------------|-----------|-------------------------|
| bOut       | BOOL      | Output signal           |
| bNegOut    | BOOL      | Output signal, inverted |

For a detailed functional description see [L\\_DFlipFlop\\_1](#).

## 19.1.76 L\_DFRFG\_1

This FB synchronises a drive (slave) to the master value of a master drive and then executes a angular synchronism with regard to the digital frequency.

## inputs

| Designator     | Data type | Information/possible settings   |
|----------------|-----------|---|
| bSetTPReceived | BOOL      | Input for status signal "Touch probe detected"  |
| dnSetTPPos_p   | DINT      | Input for accepting the position measured via touch probe   |
| nIn_v          | INT       | Speed setpoint of the master<br>• Scaling: 16384 $\equiv$ 15000 rpm   |
| bRfg0          | BOOL      | Ramp down ramp function generator to "0" (quick stop function)<br>• This input can, for instance, be connected to the status signal "quick stop active".  |
|                |           | TRUE Ramp down the ramp function generator to "0"<br>• The drive is brought to a standstill with the deceleration time set in <a href="#">C01076/2</a> .  |
| bRfgStop       | BOOL      | Stop ramp function generator  |
|                |           | TRUE Stop ramp function generator<br>• The last status is output to <i>nOut_v</i> .<br>• The speed/angle setpoint <i>nIn_v</i> is saved.<br>• After <i>bStop</i> is reset to FALSE, the setpoint angle is approached via the ramp function generator. |
| bReset         | BOOL      | Reset added angle setpoint  |
|                |           | TRUE The internally added angle setpoint is reset and the ramp function generator is activated. If the status signal <i>bFail</i> is set, it will also be reset.  |
|                |           | TRUE $\Rightarrow$ FALSE Detect speed/angle setpoint.   |

## outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bSync      | BOOL      | Status signal "Drive is running synchronously"  |
|            |           | TRUE The drive is running synchronously, the speed input id directly applied to the speed output. |
| nOut_v     | INT       | Speed/angle setpoint<br>• Scaling: 16384 $\equiv$ 15000 rpm                                       |
| bFail      | BOOL      | Status signal "Angular difference exceeded"   |
|            |           | TRUE The angular difference set in <a href="#">C01078/1</a> has been exceeded.                    |

## Parameters

| Parameters               | Possible settings |       |            | Information  |
|--------------------------|-------------------|-------|------------|--|
| <a href="#">C01076/1</a> | 0.000             | s     | 999.900    | Acceleration and deceleration time<br>• Relating to the reference speed (constant acceleration and deceleration) set in <a href="#">C00011</a> .<br>• It is a maximum value which limits the acceleration of the ramp function generator.<br>• Lenze setting: 1.000 s                  |
| <a href="#">C01076/2</a> | 0.000             | s     | 999.900    | Deceleration time for quick stop of the slave drive<br>• Relating to the reference speed (constant acceleration and deceleration) set in <a href="#">C00011</a> .<br>• It is a maximum value which limits the deceleration of the ramp function generator.<br>• Lenze setting: 0.000 s |
| <a href="#">C01077/1</a> | 1                 | rpm   | 15000      | Max. speed-up<br>• Lenze setting: 3000 rpm   |
| <a href="#">C01078/1</a> | 10                | Incr. | 2000000000 | Following error limit<br>• Scaling: A revolution is displayed with 65536 increments or steps.<br>• Lenze setting: 2000000000 incr.   |
| <a href="#">C01079/1</a> | 0                 | Incr. | 65535      | Synchronisation window (position)<br>• If the difference between the master and the slave is lower than the synchronisation window, the <i>bSync</i> status signal is set to TRUE.<br>• Lenze setting: 100 incr.   |
| <a href="#">C01080/1</a> | -2147483647       | Incr. | 2147483647 | Offset<br>• Angular offset for the internal actual position of the FB<br>• Scaling: A revolution is displayed with 65536 increments or steps.<br>• Lenze setting: 0 incr.  |

| Parameters               | Possible settings                     | Information   |
|--------------------------|---------------------------------------|---|
| <a href="#">C01081/1</a> |                                       | Sync. direction/TP function   |
|                          | 1 cw/ccw - without TP (Lenze setting) | • Selection of the direction of rotation for synchronising  |
|                          | 2 cw - without TP                     | • With high offset values and low input speed, the drive may change its direction of rotation. In order to prevent this, a direction of rotation can be permanently defined via this parameter. |
|                          | 3 ccw - without TP                    |   |
|                          | 4 cw/ccw - with TP                    |   |
|                          | 5 cw - with TP                        |   |
|                          | 6 ccw - with TP                       |   |

### 19.1.76.1 Ramp function generator (profile generator)

The ramp function generator accelerates the slave drive to the input master speed.

- Synchronising starts when the FB receives a touch probe edge from the master axis (e.g. a conveying belt) at the *bSetTPReceived* input.
- When the slave reaches the setpoint speed of the master and the made up path difference is lower than the synchronisation window set in [C01079/1](#), the *bSync* output is set to TRUE. At the same time, the FB switches the profile generator to inactive and outputs the *nIn\_v* input speed to *nOut\_v*.

[19-29] Example: Synchronisation

- [C01077/1](#) serves to set a maximum speed which limits the speed of the slave.

- The acceleration or deceleration in the synchronous point results from the acceleration/deceleration time set in [C01076/1](#).
  - Reference for the acceleration/deceleration time is the reference speed ([C00011](#)):

[19-30] Connection between acceleration time and acceleration

- Based on the input speed of the master axis, a setpoint angle is calculated from the starting time onwards which leads the actual angle of the slave.
- Dependent on the master speed and the settings for acceleration and offset, the FB may travel oversynchronously for reducing the angular difference, i.e.  $nOut\_v$  is higher than  $nIn\_v$ :

[19-31] Speed/time diagram

### Note!

- Set the maximum speed in [C01077/1](#) higher than the master speed to be expected. The speed is selected on the motor side and is independent of the reference speed ([C00011](#)). The higher the difference between maximum speed and master speed, the less time to the synchronous time is required.
- In case of a heavily oscillating input speed it may occur that directly after setting the *bSync* status signal to TRUE the FB still executes slight angle corrections.
- Generally avoid acceleration or deceleration processes of the master axis while the slave axes are synchronising.

**Tip!**

Set the synchronisation window in [C01079/1](#) higher than the amplitude of beat available on the input signal:

[19-32] Example: Beat on the input signal

### 19.1.76.2 Quick stop

The quick stop function removes the drive from the interconnection and leads it to standstill.

- Quick stop is activated by setting *bRfg0* to TRUE.
- [C01076/2](#) is used to set the delay time in [s] which refers as the acceleration/deceleration time to the reference speed ([C00011](#)).
- The angle setpoint created internally on the basis of the input signal *nln\_v* is saved.
- After *bRfg0* is reset to FALSE, the angle setpoint is approached via the ramp function generator again.

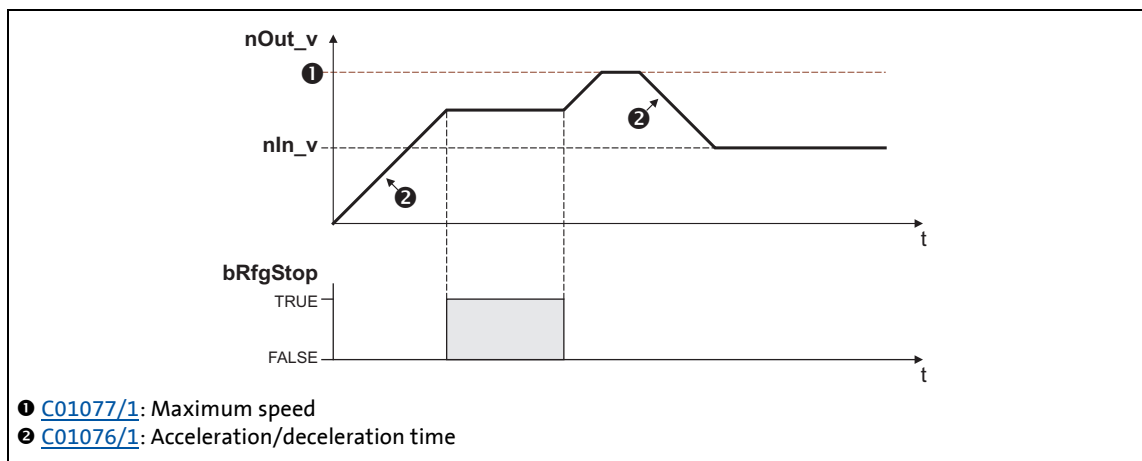

[19-33] Example: Quick stop function (QSP)

### 19.1.76.3 Ramp function generator stop

The stop function holds the status of the ramp function generator during operation.

- The stop function is activated by setting *bRfgStop* to TRUE.
- The last status is output to *nOut\_v* (16384  $\equiv$  15000 rpm).
- The angle setpoint created internally on the basis of the input signal *nIn\_v* is saved, thus the monitoring function of the angular difference between the created setpoint angle and actual angle cannot be activated.
- After *bRfgStop* is reset to FALSE, the angle setpoint is approached via the ramp function generator again.

[19-34] Example: Stop function

### 19.1.76.4 Reset angle setpoint

By setting *bReset* to TRUE, the internally created angle setpoint is set to "0" and the ramp function generator is activated.

### 19.1.76.5 Detecting the angular difference

In [C01078/1](#), a limit value for monitoring the angular difference between the created setpoint and actual angles can be set.

- Scaling: A revolution is displayed with 65536 increments or steps.
- The ramp function generator can accept a angular difference of up to  $\pm 2140000000$  increments ( $\approx 32000$  revolutions).
- If monitoring responds, the status signal *bFail* is set to TRUE.
- If the internally added angle setpoint is reset by setting *bReset* to TRUE, the *bFail* status signal is reset to FALSE.

### 19.1.76.6 Offset setting

If the time to synchronicity is too long or the slave drive must not be operated oversynchronously, either the acceleration can be adapted or the touch probe initiator can be shifted. Since this is only possible to a limited extent due to construction conditions, in this case the better solution is selecting a virtual angular offset.

- In order to reach angle synchronicity, the difference between created setpoint and actual angle must be zero:

$$\varphi_{\text{DIFF}} = \varphi_{\text{SET}} - \varphi_{\text{ACT}} = 0$$

#### Behaviour without offset

If the actual angle starts with an offset = 0, a higher difference between setpoint angle and actual angle develops:

[19-35] Example: Without offset selection (offset = 0)

## Behaviour with offset

By selecting an offset, the actual position is preloaded with a non-zero value. This reduces the distance and the time to synchronicity.

[19-36] Example 1: With offset selection

- When a positive offset is selected, the sign of the distance between setpoint and actual value changes. This distance is reduced due to the acceleration of the slave from the input of the touch probe pulse. Thus, the time to synchronicity is shorter.
- The offset refers to the master value selection and is scaled with an encoder revolution ( $\equiv 65536$  increments).
- The offset can be determined empirically, but it is sensible to calculate the required acceleration distance and select this value as offset:

$$\Phi_{\text{ACC}} = \frac{1}{2} \cdot \frac{(v_{\text{SET}})^2}{C00011 [\text{rpm}]} \cdot C01076/1 [\text{ms}] \cdot \frac{16384 [\text{incr./ms}]}{15000 [\text{rpm}]}$$

 $\phi_{ACC}$  = acceleration distance in [increments] $v_{SET}$  = setpoint speed in [rpm]

**C00011** = reference speed of the motor in [rpm]

C01076/1 = acceleration/deceleration time of the ramp generator in [ms]

The acceleration calculated from the acceleration/deceleration time ([C01076/1](#)) is a maximum acceleration that will not be reached if the input speed is reduced and the FB has to reach its target with a too high offset.

[19-37] Example 2: With offset selection and reduced input speed

### Note!

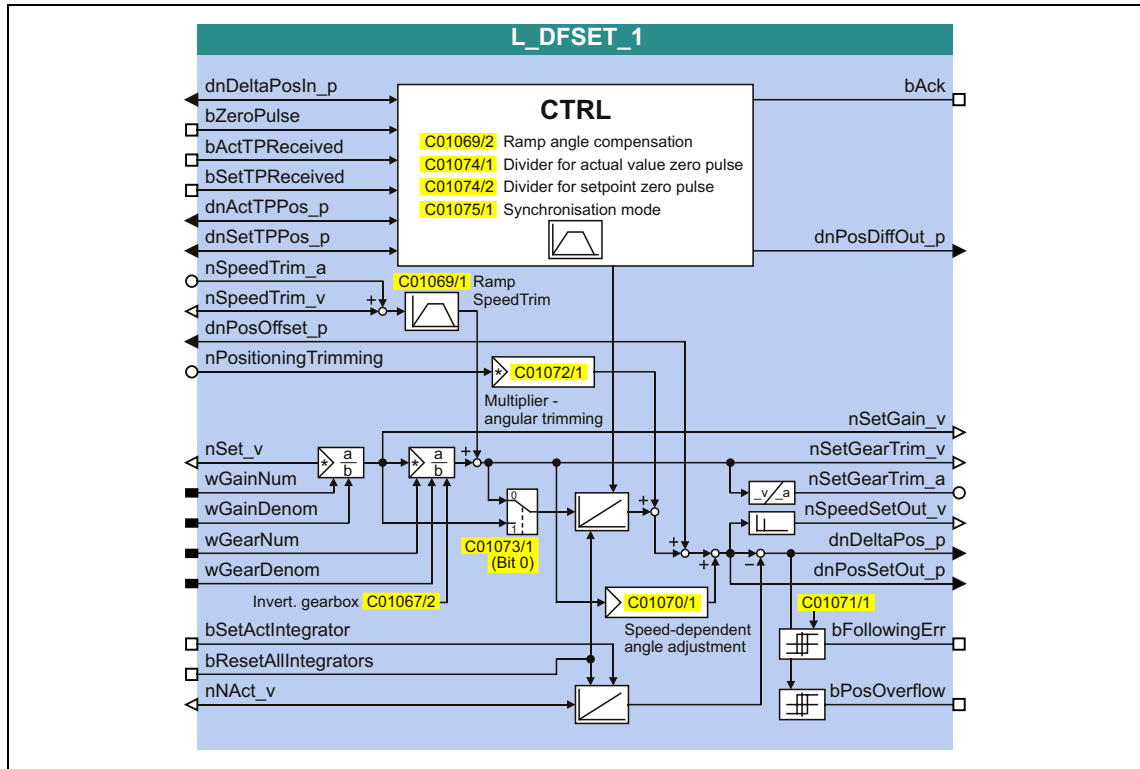

With a very low input speed, the acceleration can also get negative which causes the slave drive to change its direction of rotation.

In order to prevent a change of the direction of rotation, [C01069/1](#) serves to select a permanent direction of rotation.

## 19.1.77 L\_DFSET\_1

This FB prepares the master value for a slave drive. This FB enables the inverter to follow the master drive true to speed and angle.

- You can select values for the stretch factor and gearbox factor of the slave.
- A speed trimming or angular trimming is possible.

## inputs

| Designator     | Data type | Information/possible settings   |
|----------------|-----------|---|
| dnDeltaPosIn_p | DINT      | Input for considering a following error for the mark correction <ul style="list-style-type: none"> <li>• The value of this input is used for the following error compensation if the <i>nNAct_v</i> input is not assigned.</li> </ul> |
| bZeroPulse     | BOOL      | Enable of the zero pulse-/touch probe synchronisation for the modes 2, 10 ... 13 <ul style="list-style-type: none"> <li>• The mode is selected in <a href="#">C01075/1</a>.</li> </ul>  |
|                |           | FALSE $\nrightarrow$ TRUE    Synchronisation enabled.   |

(Required clock sequence: Set/actual or actual/set) |

### 19.1.77.1 Master value rail/slave cascade

If there is only one master speed that is transmitted to all slave drives involved, e.g. via system bus (CAN), it is called master value rail.

If a slave drive takes over the master value generation for the following slave, it is called slave cascade.

[19-38] Example: Master value rail/slave cascade

### 19.1.77.2 Setpoint conditioning with stretch factor and gearbox factor

#### Stretch factor

The stretch factor is required for the "speed synchronism via master value cascade" mode. It defines the ratio the slave drive is to be running with regard to its master value.

- The stretch factor evaluates the setpoint at the  $nSet\_v$  input.
- The stretch factor must be selected via the  $wGainNum$  and  $wGainDenom$  inputs in the form of numerators and denominators.
- The result is provided at the  $nSetGain\_v$  output.
  - Scaling:  $16384 \equiv 15000 \text{ rpm}$

$$nSetGain\_v = nSet\_v \cdot \frac{wGainNum}{wGainDenom}$$

- If the stretch factor is 1 and the gearbox factors are selected correctly, the circumferential speeds of the rolls for master and slave 1 are identical in the example shown in the illustration [\[19-38\]](#).

**Gearbox factor**

The gearbox factor defines the gearbox ratio of the drive. Enter the ratio of the drive.

- The gearbox factor evaluates the setpoint at the  $nSet\_v$  input multiplied by the stretch factor.
- The gearbox factor has to be selected via the inputs  $wGearNum$  and  $wGearDenom$  in the form of numerators and denominators.
- The bit 0 in [C01073/1](#) serves to simply deactivate the evaluation with the gearbox factor (does not apply to the speed outputs  $nSetGain\_v$ ,  $nSetGearTrim\_v$  and  $nSetGearTrim\_a$ ).
- The result is provided at the outputs  $nSetGearTrim\_v$  and  $nSetGearTrim\_a$ .
  - Scaling  $nSetGearTrim\_v$ : 16384  $\equiv$  15000 rpm
  - Scaling  $nSetGearTrim\_a$ : 16384  $\equiv$  100 % reference speed ([C00011](#))

$$nSetGearTrim\_v = nSet\_v \cdot \text{Stretch factor} \cdot \frac{wGearNum}{wGearDenom}$$

$$nSetGearTrim\_v = nSet\_v \cdot \frac{wGainNum}{wGainDenom} \cdot \frac{wGearNum}{wGearDenom}$$

$$nSetGearTrim\_a = nSet\_v \cdot \frac{C00011}{15000} \cdot \frac{wGainNum}{wGainDenom} \cdot \frac{wGearNum}{wGearDenom}$$

**Note!**

The intermediate results and the result of the evaluation are limited to  $\pm 32767$  increments (16 bits).

**19.1.77.3 Processing correction values****Speed trimming**

Speed trimming enables the connection of correction values, e.g. from a higher-level control loop. This permits an acceleration or deceleration of the drive.

The correction value can either be transmitted as an analog value via the  $nSpeedTrim\_a$  input or for exact speed trimming as a speed value via the  $nSpeedTrim\_v$  input.

- Scaling  $nSpeedTrim\_a$ : 16384  $\equiv$  100 % reference speed ([C00011](#))
- Scaling  $nSpeedTrim\_v$ : 16384  $\equiv$  15000 rpm

Speed variations of the trimming values are specified via the SpeedTrim ramp ([C01069/1](#)).

### Angular trimming

Angular trimming enables the rotor position to be put forward or back with regard to the setpoint (the drive is leading or lagging).

The correction value must have to be defined in [increments] via the *nPositionTrimming* input. It is internally added to the angle setpoint.

- Scaling: A motor revolution is mapped with 65536 increments or steps.
- The maximum angular trimming amounts to  $\pm\frac{1}{2}$  motor revolution ( $\pm 32767$  increments).
- When analog values are selected: 100 %  $\equiv \frac{1}{4}$  motor revolution  $\equiv 16384$  increments.
- The setting range can be extended with the multiplier to be set in [C01072/1](#).

### Angular offset

The *dnPosOffset\_p* input serves to define a permanent angular offset for the setpoint of the drive.

- An adjustment takes place via the following error (*dnDeltaPos\_p*) output and via the speed change at the *nSpeedSetOut\_v* output.
- Example: A angular offset of 90° is to be set on the load side with a gearbox ratio of 3.8147:

$$\text{dnPosOffset\_p} = \frac{90^\circ}{360^\circ} \cdot 65536 \left[ \frac{\text{Increments}}{\text{Motor revolution}} \right] \cdot 3.8147 = 62500 \text{ [increments]}$$

### Stop!

Change the angular offset only step by step as the FB does not contain a ram generator for preventing torque impulses.

### Speed-proportional angle adjustment

The speed-proportional angle adjustment enables a leading or lagging of the angle with increasing speed and serves to compensate dead times and transmission times.

The correction value selected in [C01070/1](#). in [increments] refers to a speed of 15000 rpm (linear relationship):

[19-39] Connection between offset/speed

#### 19.1.77.4 Synchronising slave drive to master drive

If an angular synchronism of the drives is required (e.g. in printing units), the slave drives must be positioned to the master position since the FB L\_DFSET as a master value can only receive and process one relative signal. The FB L\_DFSET receives the master value via a real-time capable MotionBus as the system bus (CAN).

#### Tip!

The 8400 TopLine serves to realise very easily a master value cascade via the cross communication with the [Axis bus](#) of the drives.

For synchronisation purposes, the slave drive is informed cyclically or once about its drive position by a pulse generated by the master drive. This pulse is either the zero pulse of the master feedback or the edge of a touch probe sensor. Moreover, a pulse must be generated by the slave drive. Only if the FB L\_DFSET receives both signals, it can execute a synchronisation.

#### Synchronisation mode - mark correction

For synchronisation, the following modes are available in [C01075/1](#) :

| Mode   | Info  |
|--|---|
| 0 Synchronisation inactive   | Lenze setting   |
| 1 Permanent synchronisation without enable via the <i>bZeroPulse</i> input <ul style="list-style-type: none"> <li>Correction is executed over the shortest possible path.</li> </ul>   | The synchronisation only takes place after 2 setpoint pulses have been received at the <i>bSetTPReceived</i> input.<br>(required pulse order: set-actual-set)<br>• See illustration <a href="#">[19-40]</a> . ( <a href="#">1596</a> )  |
| 2 Permanent synchronisation only with enable via the <i>bZeroPulse</i> input <ul style="list-style-type: none"> <li>When <i>bZeroPulse</i> is set to TRUE, a permanent zero pulse/touch probe synchronisation is executed.</li> <li>Correction is executed over the shortest possible path.</li> </ul> |   |
| 10 One-time synchronisation only with enable via the <i>bZeroPulse</i> input <ul style="list-style-type: none"> <li>An angular difference is compensated over the shortest possible path.</li> </ul>   |   |
| 11 One-time synchronisation only with enable via the <i>bZeroPulse</i> input <ul style="list-style-type: none"> <li>An angle difference is compensated in CW direction.</li> </ul>   |   |
| 12 One-time synchronisation only with enable via the <i>bZeroPulse</i> input <ul style="list-style-type: none"> <li>An angular difference is compensated in CCW direction.</li> </ul>  |   |
| 13 One-time synchronisation only with enable via the <i>bZeroPulse</i> input <ul style="list-style-type: none"> <li>An angular difference is compensated over the shortest possible path.</li> </ul>   |   |
|  | Synchronisation takes place after the first setpoint pulse has been received at the <i>bSetTPReceived</i> input and/or actual value pulse at the <i>bActTPReceived</i> input.<br>(Required clock sequence: Set/actual or actual/set)<br>• See illustration <a href="#">[19-41]</a> . ( <a href="#">1596</a> ) |

[19-40] Synchronisation process in the modes 1, 2, 10, 11, 12

[19-41] Synchronisation process in mode 13

### Compensation process

At the input of the second set or actual touch probe pulse, the difference between master and slave position is detected which is then provided via the *nSpeedSetOut\_v* speed output and equivalently as position at .

In [C01073/1](#), the following bit coded settings can be made for the compensation procedure:

| setting |   | Info  |
|---------|---|---|
| Bit 1   | Angle correction with polynomial                                  | <p>If this bit is set (Lenze setting), the compensating movement is rounded by polynomial.</p> <ul style="list-style-type: none"> <li>• The angle error to be compensated is limited to <math>\pm 1073741823</math> increments due to the system. This applies in general when the <b>L_DFSET_1</b> carries out the compensation.</li> <li>• The maximum compensating speed can be set in <a href="#">C1069/2</a>. When "0" is set in <a href="#">C1069/2</a> if activated in <a href="#">C01075/1</a>, the angle error is measured and output to <i>dnPosDiffOut_p</i>.</li> </ul> |
| Bit 2   | External angle correction<br><small>From version 13.00.00</small> | <p>If this bit is set, the FB <b>L_DFSET_1</b> does not compensate any angle errors.</p> <ul style="list-style-type: none"> <li>• Every time the angle errors have been measured, the angular difference is output to <i>dnPosDiffOut_p</i>.</li> <li>• In addition, a FALSE/TRUE edge is output to <i>bAck</i>. This signal serves to trigger an external profile generator which compensates the angular offset via a speed profile additionally.</li> </ul>  |

The following illustration shows a compensating process after the marks have been detected. The speed is added here as a parabola to the line speed. (The scaling in this diagram does not correspond to reality)

[19-42] Example: Compensation process

### 19.1.77.5 Masking out touch probe signals

When passing-through material is used, e.g. printed foil, touch probe initiators may respond several times per cycle. For suppressing such "interference pulses", count values can be selected in [C01074/1](#) and [C01074/2](#) that are decremented when the touch probe pulse has been received. Only when the counter content is "0", the synchronisation will be enabled. Please note that the settings 0 and 1 are functionally identical. If 0 or 1 is set, at least one pulse is required to activate the synchronisation.

[19-43] Synchronisation process in the modes 1, 2, 10, 11, 12 with a masking out of the touch probe pulses

### 19.1.77.6 Process monitoring functions

#### Following error

The *bFollowingErr* status output is set to TRUE if the drive cannot follow its setpoint angle.

- Possible causes:
  - The centrifugal mass is too high for the set acceleration or deceleration time.
  - The torque limit has been reached (load torque > drive torque).
- Remedy: Unload drive or increase torque limit at the servo controller (if the power limits of the inverter have not yet been reached).

The following error is derived from the angular difference of the setpoint angle integrator minus the actual angle integrator. The comparison value (following error limit) can be set in [C01071/1](#).

#### Angle controller overflow (*bPosOverflow* = TRUE)

The *bPosOverflow* status output is set to TRUE if the angular difference that can be displayed device-internally has been exceeded. Home positions get lost here.

#### Tip!

If an error response is to be triggered in case of a following error and/or angle controller overflow, connect the corresponding status output with a free *bSetError* input of the SB [LS\\_SetError\\_2](#) and parameterise the requested error response for this input in [C00581](#).

19.1.78 L\_DigitalDelay\_1

This FB applies a time delay to binary signals.

- ON and OFF-deceleration can be parameterised separately.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| bIn        | BOOL      | Input signal                  |

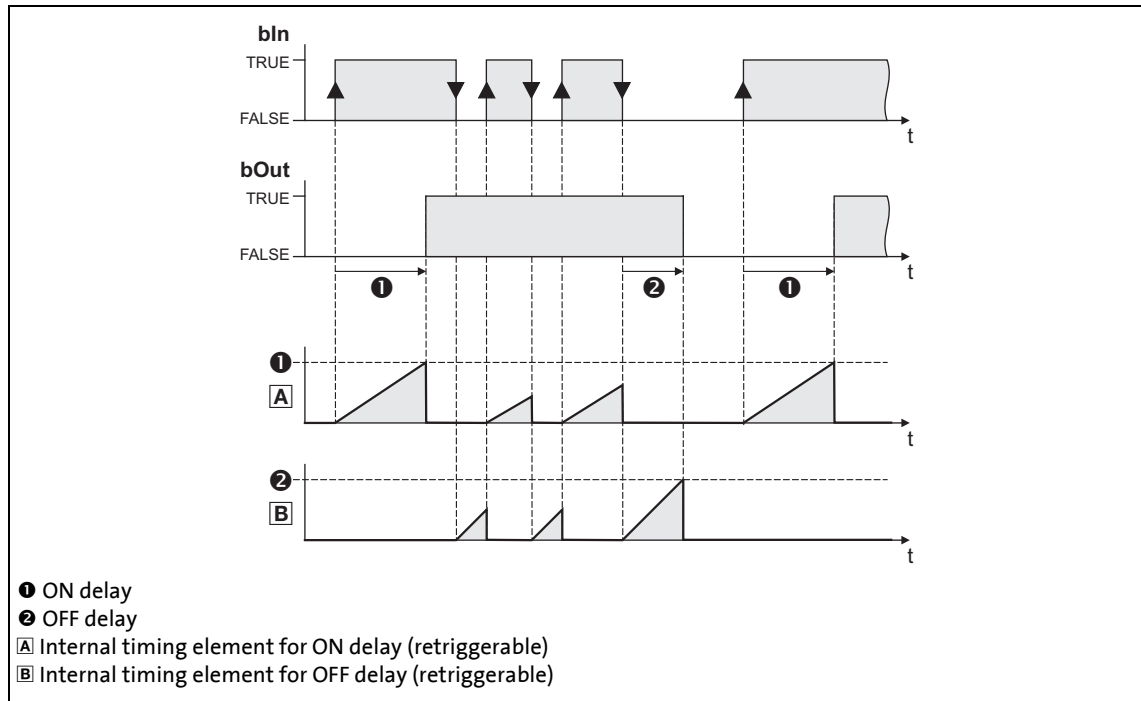

outputs

| Designator | Data type | Value/meaning                             |
|------------|-----------|---|
| bOut       | BOOL      | Output signal (time-delayed input signal) |

Parameters

| Parameters               | Possible settings |   |          | Information                                  |
|--------------------------|-------------------|---|----------|--|
| <a href="#">C00720/1</a> | 0.000             | s | 3600.000 | ON-deceleration<br>• Lenze setting: 0.000 s  |
| <a href="#">C00720/2</a> | 0.000             | s | 3600.000 | OFF-deceleration<br>• Lenze setting: 0.000 s |

## Function

1. A FALSE-TRUE edge at  $bIn$  starts the internal timing element for the ON delay.
2. After the defined ON delay, the input signal  $bIn$  is output at  $bOut$ .
3. A TRUE-FALSE edge at  $bIn$  starts the internal timing element for the OFF delay.
4. After the defined OFF delay, the input signal  $bIn$  is output at  $bOut$ .

19.1.79 L\_DigitalDelay\_2

This FB applies a time delay to binary signals.

- ON and OFF-deceleration can be parameterised separately.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| bIn        | BOOL      | Input signal                  |

outputs

| Designator | Data type | Value/meaning                             |
|------------|-----------|---|
| bOut       | BOOL      | Output signal (time-delayed input signal) |

Parameters

| Parameters               | Possible settings |   |          | Information                                  |

| <a href="#">C00721/4</a> | 0.000             | s | 3600.000 | OFF-deceleration<br>• Lenze setting: 0.000 s |

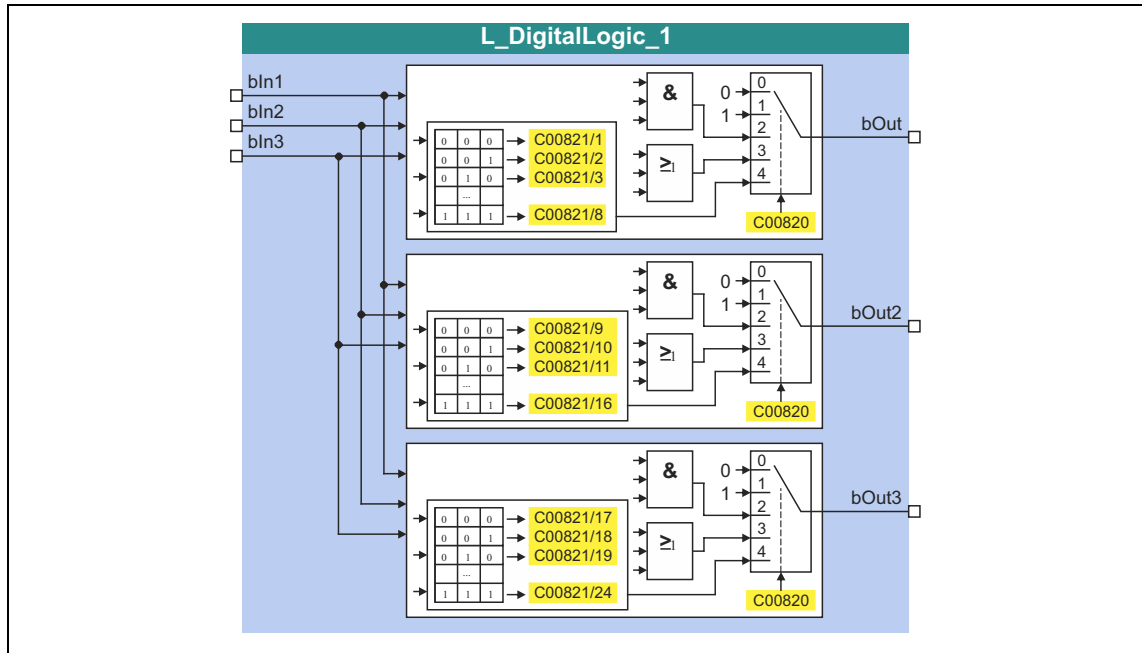

For a detailed description see [L\\_DigitalDelay\\_1](#).

### 19.1.81 L\_DigitalLogic\_1

This FB provides a binary output signal created by a logic operation of the input signals. Optionally, one of the constant binary values independent from the input signals can be output.

- Output of a constant binary value
- AND operation of the inputs
- OR operation of the inputs
- Output depending on the combination of the input signals

#### inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| bln1       | BOOL      | Input signal 1                |
| bln2       | BOOL      | Input signal 2                |
| bln3       | BOOL      | Input signal 3                |

#### outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bOut       | BOOL      | Output signal 1   |
| bOut2      | BOOL      | Output signal 2<br>• <a href="#">bOut2 is available from version 16.00.00 onwards</a> |
| bOut3      | BOOL      | Output signal 3<br>• <a href="#">bOut3 is available from version 16.00.00 onwards</a> |

## Parameters

| Parameters                    | Possible settings  | Information  |
|-------------------------------|--|--|
| <a href="#">C00820</a>        |  | Function selection   |
|                               | 0 "0"  | Constant value "FALSE"   |
|                               | 1 "1"  | Constant value "TRUE"  |
|                               | 2<br>$bOut = bIn1 \wedge bIn2 \wedge bIn3$<br>$bOut2 = bIn1 \wedge bIn2 \wedge bIn3$<br>$bOut3 = bIn1 \wedge bIn2 \wedge bIn3$ | AND operation<br><ul style="list-style-type: none"> <li><a href="#">bOut2 and bOut3 are available from version 16.00.00 onwards</a></li> </ul>   |
|                               | 3<br>$bOut = bIn1 \vee bIn2 \vee bIn3$<br>$bOut2 = bIn1 \vee bIn2 \vee bIn3$<br>$bOut3 = bIn1 \vee bIn2 \vee bIn3$             | OR operation<br><ul style="list-style-type: none"> <li><a href="#">bOut2 and bOut3 are available from version 16.00.00 onwards</a></li> </ul>  |
|                               | 4<br>$bOut = f(\text{truth table})$<br>$bOut2 = f(\text{truth table})$<br>$bOut3 = f(\text{truth table})$                      | The output value depends on the truth table parameterised in <a href="#">C00821/1...24</a><br><ul style="list-style-type: none"> <li><a href="#">bOut2 and bOut3 are available from version 16.00.00 onwards</a></li> </ul>  |
| <a href="#">C00821/1...24</a> |  | Truth table for function "4: $bOut = f(\text{truth table})$ "<br><ul style="list-style-type: none"> <li>Each of the eight possible input combinations can be assigned to the output value FALSE or TRUE.</li> <li>For an application example see the following section.</li> </ul> |
|                               | 0 FALSE  |  |
|                               | 1 TRUE   |  |

## Function 4

If the function 4 is selected in [C00820](#), the output values depend on the truth table parameterised in [C00821/1...24](#).

The following table shows which setting may be required in [C00821/1...24](#) to realise the logic operations NAND, NOR, XOR and XNOR:

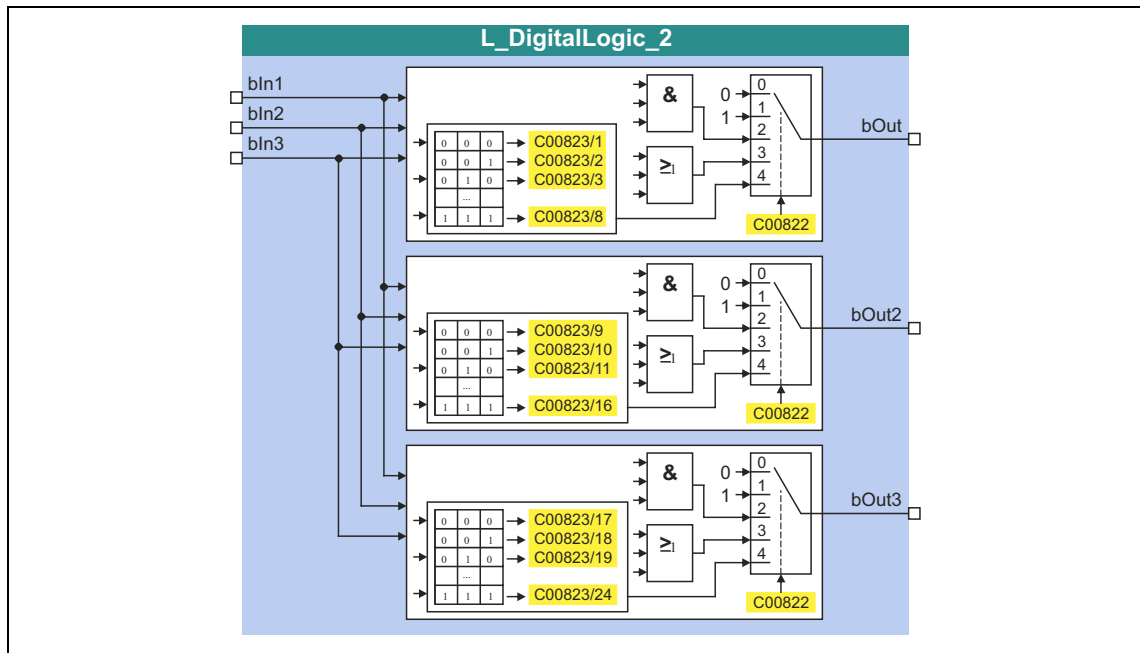

| Input signals |             |             | Output                   |                           |                           | Parameter setting for logic operation |      |     |     |      |
|---------------|-------------|-------------|--------------------------|---------------------------|---------------------------|---------------------------------------|------|-----|-----|------|
| <i>bIn3</i>   | <i>bIn2</i> | <i>bIn1</i> | <i>bOut</i>              | <i>bOut2</i>              | <i>bOut3</i>              |                                       | NAND | NOR | XOR | XNOR |
| 0             | 0           | 0           | <a href="#">C00821/1</a> | <a href="#">C00821/9</a>  | <a href="#">C00821/17</a> | =                                     | 1    | 1   | 0   | 1    |

19.1.84 L\_DigitalLogic5\_1

This FB provides a binary output signal created by a logic operation of the input signals. Optionally, one of the constant binary values independent from the input signals can be output.

- Output of a constant binary value
- Output depending on the combination of the input signals

inputs

| Designator          | Data type | Information/possible settings |
|---------------------|-----------|-------------------------------|
| bIn1<br>...<br>bIn5 | BOOL      | Input signal 1 ... 5          |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| bOut       | BOOL      | Output signal |

Parameters

| Parameters             | Possible settings        | Information  |
|------------------------|--------------------------|--|
| <a href="#">C00824</a> |                          | Function selection   |
|                        | 0 "0"                    | Constant value "FALSE"   |
|                        | 1 "1"                    | Constant value "TRUE"  |
|                        | 2 bOut = f (truth table) | The output value depends on the parameterised truth table  |
| <a href="#">C00825</a> | see truth table          | Truth table<br>Each of the 32 possible input combinations can be assigned to the output value FALSE or TRUE. |

Truth table for C00824 = 4

| bIn5  | bIn4  | bIn3  | bIn2  | bIn1  | Output signal bOut                       |
|-------|-------|-------|-------|-------|--|
| FALSE | FALSE | FALSE | FALSE | FALSE | <a href="#">C00825/1</a> (FALSE or TRUE) |
| FALSE | FALSE | FALSE | FALSE | TRUE  | <a href="#">C00825/2</a> (FALSE or TRUE) |

---

| bIn5  | bIn4  | bIn3  | bIn2  | bIn1  | Output signal bOut                         |
|-------|-------|-------|-------|-------|--|
| FALSE | FALSE | FALSE | TRUE  | FALSE | <a href="#">C00825/3</a> (FALSE or TRUE)   |
| ...   |       |       |       |       | <a href="#">C00825/...</a> (FALSE or TRUE) |
| TRUE  | TRUE  | TRUE  | FALSE | TRUE  | <a href="#">C00825/30</a> (FALSE or TRUE)  |
| TRUE  | TRUE  | TRUE  | TRUE  | FALSE | <a href="#">C00825/31</a> (FALSE or TRUE)  |
| TRUE  | TRUE  | TRUE  | TRUE  | TRUE  | <a href="#">C00825/32</a> (FALSE or TRUE)  |

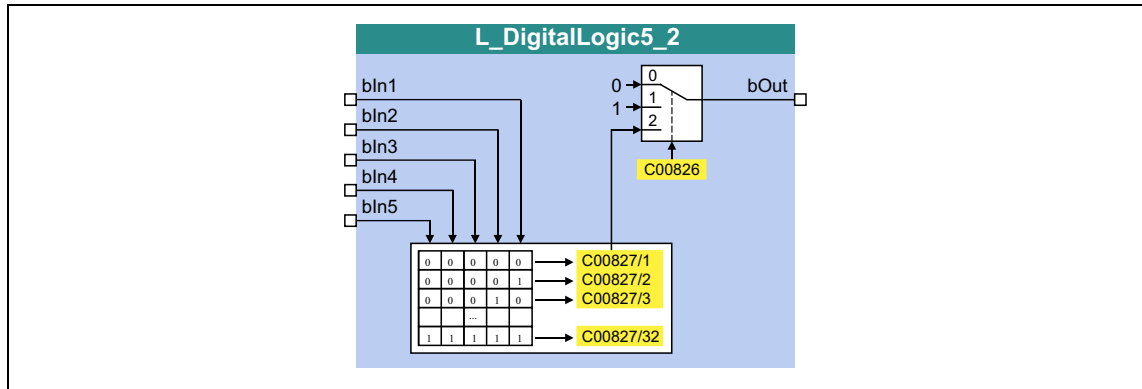

Example: If in case of the signal combination *bIn1* = TRUE, *bIn2* = FALSE, *bIn3* = TRUE, *bIn4* = TRUE and *bIn5* = TRUE, the output signal *bOut* is to be = TRUE, [C00825/30](#) must be set to "TRUE":

| bIn5 | bIn4 | bIn3 | bIn2  | bIn1 | Output signal bOut               |
|------|------|------|-------|------|----------------------------------|
| TRUE | TRUE | TRUE | FALSE | TRUE | <a href="#">C00825/30</a> (TRUE) |

### 19.1.85 L\_DigitalLogic5\_2

This FB provides a binary output signal created by a logic operation of the input signals. Optionally, one of the constant binary values independent from the input signals can be output.

- Output of a constant binary value
- Output depending on the combination of the input signals

#### inputs

| Designator          | Data type | Information/possible settings |
|---------------------|-----------|-------------------------------|
| bIn1<br>...<br>bIn5 | BOOL      | Input signal 1 ... 5          |

#### outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| bOut       | BOOL      | Output signal |

#### Parameters

| Parameters             | Possible settings        | Information  |
|------------------------|--------------------------|--|
| <a href="#">C00826</a> |                          | Function selection   |
|                        | 0 "0"                    | Constant value "FALSE"   |
|                        | 1 "1"                    | Constant value "TRUE"  |
|                        | 2 bOut = f (truth table) | The output value depends on the parameterised truth table  |
| <a href="#">C00827</a> | see truth table          | Truth table<br>Each of the 32 possible input combinations can be assigned to the output value FALSE or TRUE. |

#### Truth table for C00826 = 4

| bIn5  | bIn4  | bIn3  | bIn2  | bIn1  | Output signal bOut                       |
|-------|-------|-------|-------|-------|--|
| FALSE | FALSE | FALSE | FALSE | FALSE | <a href="#">C00827/1</a> (FALSE or TRUE) |
| FALSE | FALSE | FALSE | FALSE | TRUE  | <a href="#">C00827/2</a> (FALSE or TRUE) |

---

| bIn5  | bIn4  | bIn3  | bIn2  | bIn1  | Output signal bOut                         |
|-------|-------|-------|-------|-------|--|
| FALSE | FALSE | FALSE | TRUE  | FALSE | <a href="#">C00827/3</a> (FALSE or TRUE)   |
| ...   |       |       |       |       | <a href="#">C00827/...</a> (FALSE or TRUE) |
| TRUE  | TRUE  | TRUE  | FALSE | TRUE  | <a href="#">C00827/30</a> (FALSE or TRUE)  |
| TRUE  | TRUE  | TRUE  | TRUE  | FALSE | <a href="#">C00827/31</a> (FALSE or TRUE)  |
| TRUE  | TRUE  | TRUE  | TRUE  | TRUE  | <a href="#">C00827/32</a> (FALSE or TRUE)  |

Example: If in case of the signal combination *bIn1* = TRUE, *bIn2* = FALSE, *bIn3* = TRUE, *bIn4* = TRUE and *bIn5* = TRUE, the output signal *bOut* is to be = TRUE, [C00827/30](#) must be set to "TRUE":

| bIn5 | bIn4 | bIn3 | bIn2  | bIn1 | Output signal bOut               |
|------|------|------|-------|------|----------------------------------|
| TRUE | TRUE | TRUE | FALSE | TRUE | <a href="#">C00827/30</a> (TRUE) |

19.1.86 L\_DT1\_1

This FB differentiates signals. The function block can be used for acceleration feedforward (dv/dt), for example.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn_a      | INT       | Input signal                  |

outputs

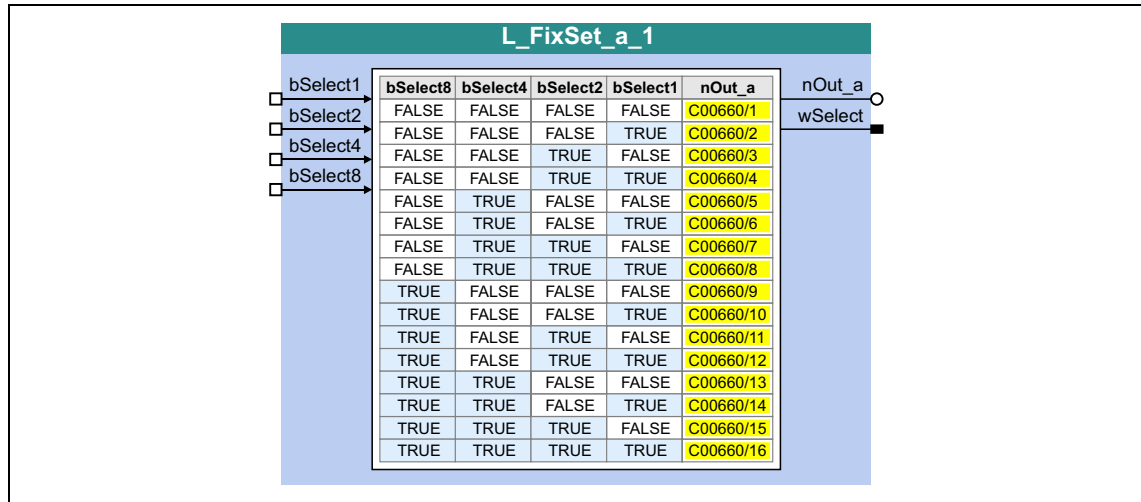

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

Parameters

| Parameters             | Possible settings   |         |        | Information   |
|------------------------|---|---------|--------|---|
| <a href="#">C00251</a> | 10  | ms      | 5000   | Time constant Tn<br>• Lenze setting: 1000 ms  |
| <a href="#">C00252</a> | -320.00   |         | 320.00 | Gain factor Vp<br>• Lenze setting: 1.00   |
| <a href="#">C00253</a> | <b>Note:</b> The most significant bit determines the sign of the value, the remaining bits determine the numerical value. |         |        | Selection of sensitivity<br>• Depending on the selection, the number of indicated higher-order bits is evaluated.<br>• Lenze setting: 15 bits |
|                        | 1   | 15 bits |        | Bit 0 ... bit 14 are evaluated  |
|                        | 2   | 14 Bit  |        | Bit 0 ... bit 13 are evaluated  |
|                        | 3   | 13 bits |        | Bit 0 ... bit 12 are evaluated  |
|                        | 4   | 12 bits |        | Bit 0 ... bit 11 are evaluated  |
|                        | 5   | 11 Bit  |        | Bit 0 ... bit 10 are evaluated  |
|                        | 6   | 10 Bit  |        | Bit 0 ... bit 9 are evaluated   |
|                        | 7   | 9 Bit   |        | Bit 0 ... bit 8 are evaluated   |

## 19.1.87 L\_FixSet\_a\_1

This FB outputs one of 16 parameterisable analog signals. Binary coded selection of the "fixed value" to be output via the four selection inputs.

## inputs

| Designator            | Data type | Information/possible settings  |
|-----------------------|-----------|--|
| bSelect1 ... bSelect8 | BOOL      | Binary coded selection of the fixed value to be output<br>• See truth table displayed in the FB above. |

## outputs

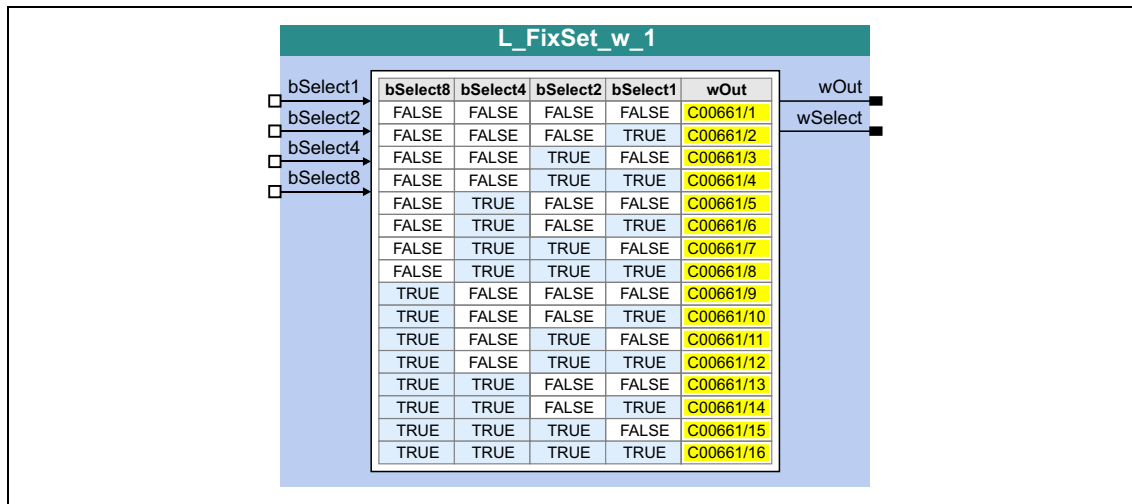

| Designator | Data type | Value/meaning                      |
|------------|-----------|------------------------------------|
| nOut_a     | INT       | Output of the selected fixed value |
| wSelect    | WORD      | Current selection (0 ... 15)       |

## Parameters

| Parameters                    | Possible settings          | Information                                     |
|-------------------------------|----------------------------|---|
| <a href="#">C00660/1...16</a> | -199.99      %      199.99 | Fixed value 0 ... 15<br>• Lenze setting: 0.00 % |

## 19.1.88 L\_FixSet\_w\_1

This FB outputs one of 16 parameterisable data words. Binary coded selection of the "fixed value" to be output via the four selection inputs.

## inputs

| Designator            | Data type | Information/possible settings  |
|-----------------------|-----------|--|
| bSelect1 ... bSelect8 | BOOL      | Binary coded selection of the fixed value to be output<br>• See truth table displayed in the FB above. |

## outputs

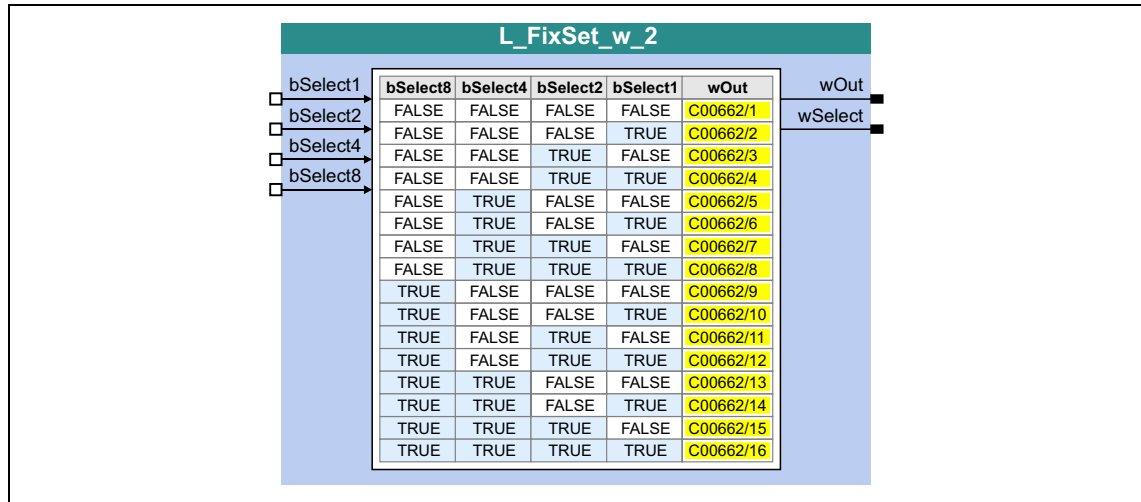

| Designator | Data type | Value/meaning                      |
|------------|-----------|------------------------------------|
| wOut       | WORD      | Output of the selected fixed value |
| wSelect    | WORD      | Current selection (0 ... 15)       |

## Parameters

| Parameters                    | Possible settings | Information  |
|-------------------------------|-------------------|--|
| <a href="#">C00661/1...16</a> | 0                 | 65535<br>Fixed values 0 ... 15<br>• Lenze setting: 0 |

## 19.1.89 L\_FixSet\_w\_2

This FB outputs one of 16 parameterisable data words. Binary coded selection of the "fixed value" to be output via the four selection inputs.

## inputs

| Designator            | Data type | Information/possible settings  |
|-----------------------|-----------|--|
| bSelect1 ... bSelect8 | BOOL      | Binary coded selection of the fixed value to be output<br>• See truth table displayed in the FB above. |

## outputs

| Designator | Data type | Value/meaning                      |
|------------|-----------|------------------------------------|
| wOut       | WORD      | Output of the selected fixed value |
| wSelect    | WORD      | Current selection (0 ... 15)       |

## Parameters

| Parameters                    | Possible settings | Information  |
|-------------------------------|-------------------|--|
| <a href="#">C00662/1...16</a> | 0                 | 65535<br>Fixed values 0 ... 15<br>• Lenze setting: 0 |

19.1.90 L\_GainOffset\_1

This FB can amplify an analog input signal and add an offset to it afterwards. Preferably to be interconnected directly after the analog input terminals.

- The internal calculations (addition and subtraction) are carried out with 32 bits without overflow/underflow. Division is not remainder considered.
- Gain and offset are selected via FB inputs.
- The value provided at the *nOut\_a* output is internally limited to ±199.99 %.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nIn_a      | INT       | Input signal <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li></ul>                       |
| nGain_a    | INT       | Gain factor <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li><li>• 199.99 % ≈ 2</li></ul> |
| nOffset_a  | INT       | Offset <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li></ul>                             |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut_a     | INT       | Output signal <ul style="list-style-type: none"><li>• Internal limitation to ±199.99 %</li></ul> |

Function

$$nOut\_a = (nIn\_a \cdot \text{Gain factor}) + \text{Offset}$$

19.1.91 L\_GainOffset\_2

This FB can amplify an analog input signal and add an offset to it afterwards. Preferably to be interconnected directly after the analog input terminals.

- The internal calculations (addition and subtraction) are carried out with 32 bits without overflow/underflow. Division is not remainder considered.
- Gain and offset are selected via FB inputs.
- The value provided at the *nOut\_a* output is internally limited to ±199.99 %.

inputs

| Designator | Data type | Information/possible settings  |
|------------|-----------|--|
| nIn_a      | INT       | Input signal <ul style="list-style-type: none"><li>• Scaling: 16384 <math>\equiv</math> 100 %</li></ul>  |
| nGain_a    | INT       | Gain factor <ul style="list-style-type: none"><li>• Scaling: 16384 <math>\equiv</math> 100 %</li><li>• 199.99 % <math>\approx</math> 2</li></ul> |
| nOffset_a  | INT       | Offset <ul style="list-style-type: none"><li>• Scaling: 16384 <math>\equiv</math> 100 %</li></ul>  |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut_a     | INT       | Output signal <ul style="list-style-type: none"><li>• Internal limitation to <math>\pm 199.99</math> %</li></ul> |

Function

$$nOut\_a = (nIn\_a \cdot \text{Gain factor}) + \text{Offset}$$

19.1.92 L\_GainOffset\_3

This FB can amplify an analog input signal and add an offset to it afterwards. Preferably to be interconnected directly after the analog input terminals.

- The internal calculations (addition and subtraction) are carried out with 32 bits without overflow/underflow. Division is not remainder considered.
- Gain and offset are selected via FB inputs.
- The value provided at the *nOut\_a* output is internally limited to ±199.99 %.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nIn_a      | INT       | Input signal <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li></ul>                       |
| nGain_a    | INT       | Gain factor <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li><li>• 199.99 % ≈ 2</li></ul> |
| nOffset_a  | INT       | Offset <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li></ul>                             |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nOut_a     | INT       | Output signal <ul style="list-style-type: none"><li>• Internal limitation to ±199.99 %</li></ul> |

Function

$$nOut\_a = (nIn\_a \cdot \text{Gain factor}) + \text{Offset}$$

19.1.93 L\_GainOffsetP\_1

This FB can amplify an analog input signal and add an offset to it afterwards. Preferably to be interconnected directly after the analog input terminals.

- The internal calculations (addition and subtraction) are carried out with 32 bits without overflow/underflow. Division is not remainder considered.
- Gain and offset are selected via parameters.
- The value provided at the *nOut\_a* output is internally limited to ±199.99 %.

inputs

| Designator   | Data type | Information/possible settings   |
|--------------|-----------|---|
| <i>nIn_a</i> | INT       | Input signal <ul style="list-style-type: none"><li>• Scaling: 16384 ≙ 100 %</li></ul> |

outputs

| Designator    | Data type | Value/meaning  |
|---------------|-----------|--|
| <i>nOut_a</i> | INT       | Output signal <ul style="list-style-type: none"><li>• Internal limitation to ±199.99 %</li></ul> |

Parameters

| Parameters               | Possible settings |   |        | Information  |

| <a href="#">C00677/5</a> | -199.99           | % | 199.99 | Gain factor <ul style="list-style-type: none"><li>• Lenze setting: 100.00 %</li><li>• 199.99 % <math>\approx</math> 2</li></ul> |
| <a href="#">C00677/6</a> | -199.99           | % | 199.99 | Offset <ul style="list-style-type: none"><li>• Lenze setting: 0.00 %</li></ul>  |

Function

$$nOut\_a = (nIn\_a \cdot \text{Gain factor}) + \text{Offset}$$

19.1.96 L\_GainOffsetPhiP\_1

This FB can amplify an angle signal and add an offset to it afterwards.

- The internal calculations (addition and subtraction) are carried out with 32 bits without overflow/underflow. Division is not remainder considered.
- Gain and offset are selected via parameters.
- The value provided at the *dnOut\_p* output is internally limited to  $\pm 2^{31}-1$ .

inputs

### Function

Elasticity is a measure of how far the load have moved from the ideal setpoint position at motor standstill due to mechanical force effect.

- Example: "Hoist":  
Due to elasticity of the mechanical transmission elements, the real position of the "hook" varies in loaded and unloaded status.
- In order to compensate errors caused by elasticity, the actual torque at the *nTorque\_a* input is applied. This torque is a measure for the current load.
- The multiplication by an elasticity factor results in an angle compensation value which is added to the setpoint angle correctly signed depending on the direction of the torque. This serves to correct the false position of the load.
- The elasticity factor is selected in the form of numerator and denominator via [C01048/1](#) and [C01048/2](#).
- [C01047/1](#) serves to select a static correction value (offset).

### Note!

Please note that the compensation may be reversed in case of a signed numerator/denominator selection of the elasticity factor!

## 19.1.99 L\_Interpolator\_1

This FB interpolates a position setpoint and/or an analog value e.g. to compensate for larger bus transmission cycles or to continue signal characteristics if data telegrams are missing.

## inputs

| Designator      | Data type | Information/possible settings  |
|-----------------|-----------|--|
| dnPhiIn_p       | DINT      | Position setpoint <ul style="list-style-type: none"> <li>Is interpolated and completed when signal interpolation is activated.</li> </ul>  |
| nPhdIn_v        | INT       | Angular velocity <ul style="list-style-type: none"> <li>Is only passed through to the <i>nPhdOut_v</i> output.</li> </ul>  |
| nNIn            | INT       | Analog value <ul style="list-style-type: none"> <li>Is interpolated when signal interpolation is activated.</li> </ul>   |
| bSpeedAct0      | BOOL      | Input for detecting the "Current speed is zero" status <ul style="list-style-type: none"> <li>This status signal needs to be transmitted by the setpoint source to ensure trouble-free operation.</li> </ul>   |
|                 |           | TRUE The current speed is zero. The interpolator in the follow-up controller is kept to the <i>dnPhiIn_p</i> input. <ul style="list-style-type: none"> <li>This function is for instance required for referencing the axis. Since in this case, the axis can move independently of the master position, the follow-up controller is not allowed to intervene.</li> </ul> |
| dnPosSetCycle_p | DINT      | Master cycle length <ul style="list-style-type: none"> <li>By specifying the master cycle length, the overflows of the Modulo signal are processed correctly in the "position follower" mode.</li> </ul>   |

## outputs

| Designator   | Data type | Value/meaning  |
|--------------|-----------|--|
| dnPhiOut_p   | DINT      | Output of the <i>dnPhiIn_p</i> position setpoint which, if applicable, has been interpolated and completed                               |
| nPhdOut_v    | INT       | Output of the <i>nPhdIn_v</i> angular velocity   |
| nNOut        | INT       | Output of the <i>nNIn</i> analog value which, if applicable, has been interpolated   |
| bPulse       | BOOL      | "Input values have been accepted" status signal  |
|              |           | TRUE The input values have been accepted during this cycle.  |
| bSignalError | BOOL      | "Signal error" status signal <ul style="list-style-type: none"> <li>Only if signal monitoring is active (C00950/2 = "1: On").</li> </ul> |
|              |           | TRUE The number of missing data telegrams has exceeded the limit value parameterised in C00952.  |

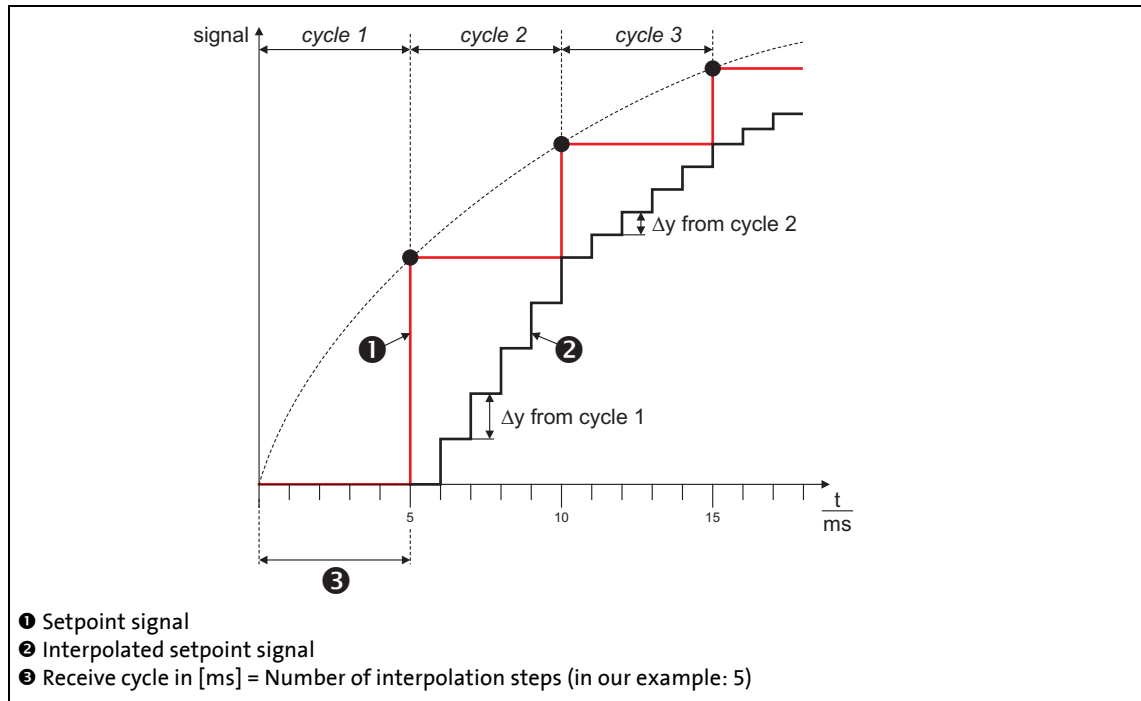

## Parameters

### 19.1.99.1 Signal interpolation

If signal interpolation is active ([C00950/1](#) = 1), the output signal will not reach the level of the corresponding input signal until all interpolation steps parameterised in [C00951](#) have been performed:

[19-44] Signal characteristic

#### Note!

Do not change the number of interpolation steps during operation. Otherwise the interpolation becomes inaccurate.

### 19.1.99.2 Signal monitoring

If signal monitoring is active ([C00950/2](#) = 1), the signal characteristic of the *dnPhIn\_p* input signal is continued even if the data telegram is missing (setpoint selection via CAN).

Monitoring is performed on the basis of the *dnPhIn\_p* position setpoint and the *bSpeedAct0* status signal:

- If the *dnPhIn\_p* position setpoint remains the same in the next device cycle, it is either because the speed is zero or because no data telegram has been received.
- The evaluation of the *bSpeedAct0* status signal gives information about which reason applies. This status signal needs to be transmitted by the setpoint source to ensure trouble-free operation:
  - *bSpeedAct0* = FALSE means that the speed is not zero, so an error is assumed: The signal characteristic of the *dnPhIn\_p* input signal is completed (the current slope is retained).
  - *bSpeedAct0* = TRUE means that the speed is zero, so the unchanged position setpoint is not treated as an error.
- If the number of missing data telegrams exceeds the limit value parameterised in [C00952](#), the *bSignalError* output is set to TRUE.
  - The *bSignalError* output is automatically reset to FALSE if correct signals are detected at *dnPhIn\_p* and *bSpeedAct0* again.

#### Note!

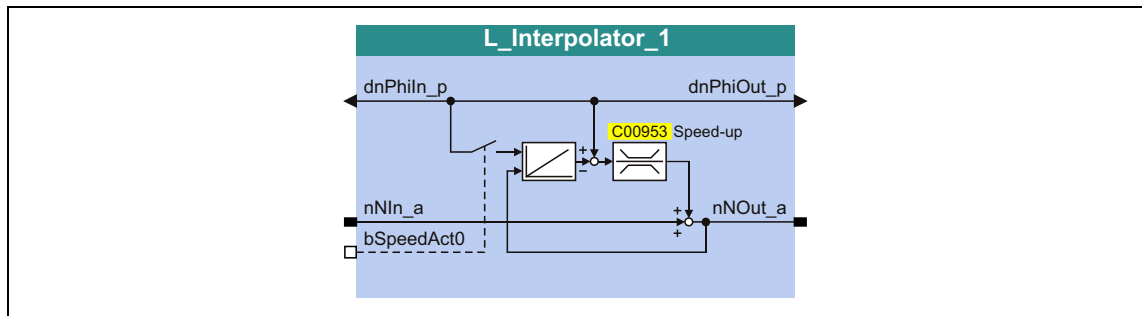

The analog value *nNIn* is not monitored!

### 19.1.99.3 Angle correction in case of transmission errors

If an angular offset between master and slave is caused due to transmission errors (missing data telegrams), it will be corrected by a catch-up function in the FB. For this purpose, the following connections and parameter settings are required for the slave at the FB **L\_Interpolator\_1**:

1. The master angle of the master is connected to the *dnPhiln\_p* input.
2. The speed signal of the master is connected to the *nNIn* input.
3. The *nNOut* output is connected to the *nSet\_v* input of the FB **L\_DFSET\_1**.

The following illustration shows the principle of the catch-up function in the FB **L\_Interpolator\_1**:

[19-45] Principle of the catch-up function

The speed signal at *nNIn* is provided almost 1:1 at the *nNOut* output. In case of a telegram error, a correction value can be added to the signal. This correction value results from the subtraction of the integrated speed signal from the position value applied at *dnPhiln\_p*.

If, for example, a data telegram should fail, the input values remain constant for one program cycle. During the next cycle, the correct position and the correct speed are restored.

"Holding" the position at *dnPhiln\_p* results in a difference between the position values at *dnPhiln\_p* and at the output of the integrator. This difference is added to the *nNOut\_a* output signal.

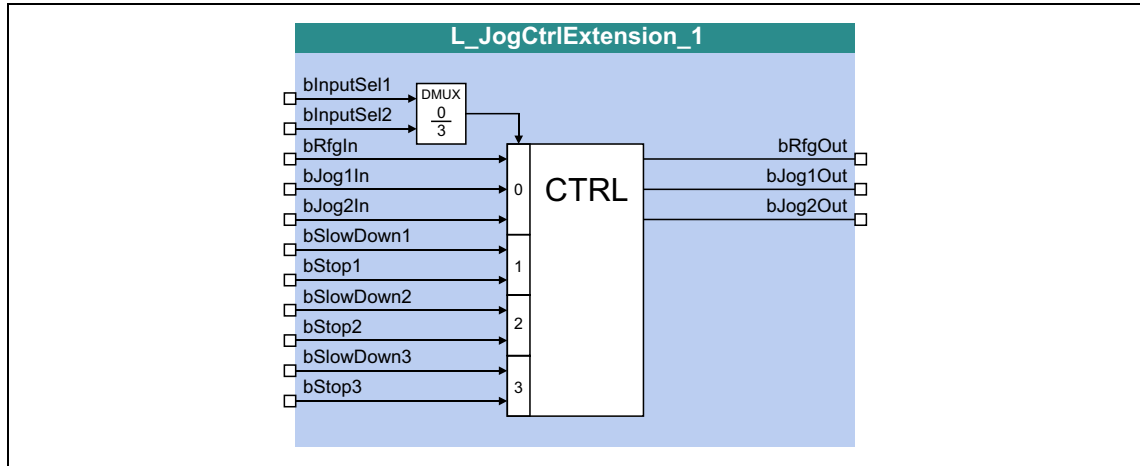

In order that this angle correction does not lead to a strong jerk in the master value, the amount of correction increments is limited per cycle (catch-up cycle) using **C00953**. A typical correction value is for instance 10 increments/ms.

When the controller is inhibited, the integrator is to be loaded with the position value pending at *dnPhiln\_p* by setting the *bSpeedAct0* input to TRUE. When the controller is enabled, the *nNOut* speed signal is integrated.

## 19.1.100 L\_JogCtrlExtension\_1

This FB can be connected upstream to the [L\\_NSet](#) ramp function generator/setpoint generator to implement a switch-off positioning at limit switch.

- Detailed information on this operating mode can be found in the description  
 ▶ [TA "Switch-off positioning"](#) (□ 544).

## inputs

| Designator                             | Data type | Information/possible settings   |
|--|-----------|---|
| bInputSel1<br>bInputSel2               | BOOL      | Activation of the <i>bSlowDown1/bStop1</i> , <i>bSlowDown2/bStop2</i> and <i>bSlowDown3/bStop3</i> signal pairs according to the <a href="#">Truth table</a>  |
| bRfgIn                                 | BOOL      | Ramping down of the setpoint generator in the downstream <a href="#">L_NSet</a> FB according to the <a href="#">Truth table</a>   |

[19-1] Truth table for activating the pre-switch off

19.1.101 L\_Limit\_1

This FB limits an analog input signal to a value range whose upper and lower limit can be set via parameters.

inputs

| Designator | Data type | Information/possible settings            |
|------------|-----------|--|
| nIn_a      | INT       | Input signal<br>• Scaling: 16384 ≙ 100 % |

outputs

| Designator | Data type | Value/meaning                             |
|------------|-----------|---|
| nOut_a     | INT       | Output signal<br>• Scaling: 16384 ≙ 100 % |

Parameters

| Parameters               | Possible settings |   |        | Information                               |
|--------------------------|-------------------|---|--------|---|
| <a href="#">C00630/1</a> | -199.99           | % | 199.99 | Lower limit<br>• Lenze setting: -100.00 % |
| <a href="#">C00630/2</a> | -199.99           | % | 199.99 | Upper limit<br>• Lenze setting: 100.00 %  |

Tip!

Always set the lower limit lower than the upper limit, otherwise value "0" is provided at the *nOut\_a* output.

19.1.102 L\_Limit\_2

This FB limits an analog input signal to a value range whose upper and lower limit can be set via parameters.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nIn_a      | INT       | Input signal <ul style="list-style-type: none"> <li>• Scaling: 16384 ≡ 100 %</li> </ul> |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|

|------------|-----------|---------------|
| dnOut_p    | INT       | Output signal |

Parameters

| Parameters               | Possible settings |       |            | Information                                       |
|--------------------------|-------------------|-------|------------|---|
| <a href="#">C00631/5</a> | -2147483647       | Incr. | 2147483647 | Lower limit<br>• Lenze setting: -2147483647 incr. |
| <a href="#">C00631/6</a> | -2147483647       | Incr. | 2147483647 | Upper limit<br>• Lenze setting: 2147483647 incr.  |

Tip!

Always set the lower limit lower than the upper limit, otherwise value "0" is provided at the *dnOut\_p* output.

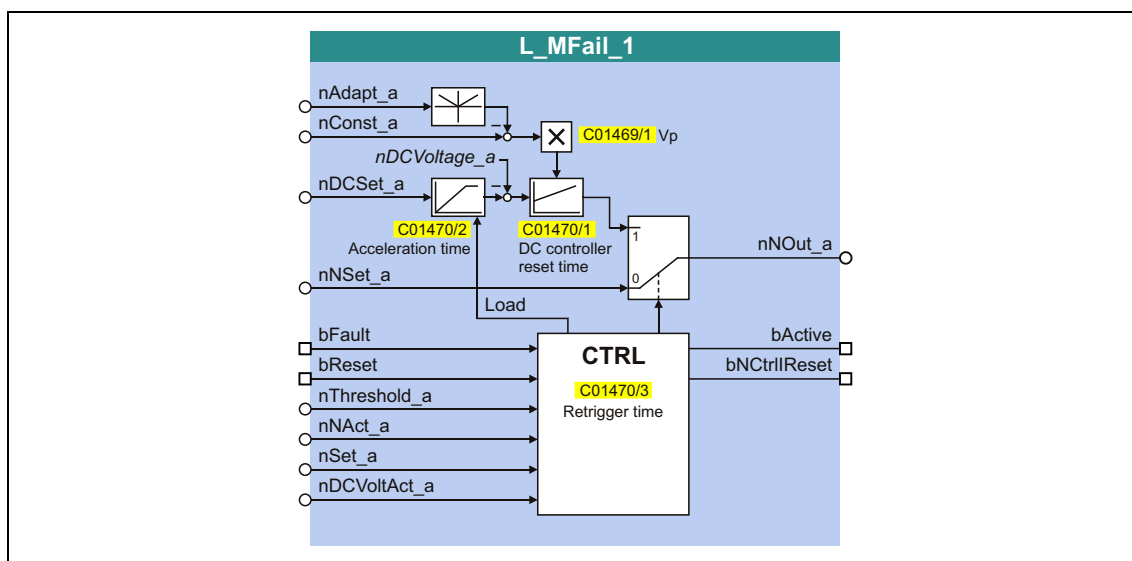

## 19.1.106 L\_MFail\_1

In case the supply voltage fails, this FB serves to stop (brake) the drive or drive system in a controlled way via L1, L2, L3 or +UG, -UG to prevent coasting.

**Stop!**

For drive systems that are coupled via digital frequency (a master drive and one or several slave drives) the following applies:

- The mains failure detection and control may only be activated for the master drive.
- All inverters must be operated via the terminals +UG, -UG in the DC bus connection.

**inputs**

| Designator   | Data type                       | Information/possible settings   |

### 19.1.106.1 Procedure of the mains failure control

A failure of the voltage supply of the power section can be detected by

- an evaluation of the DC-bus voltage and/or
- an external monitoring system (e.g. voltage measuring relay).

The type of mains failure control to be used depends on the used drive system.

#### Note!

The following interconnection examples are not functional yet. For an error-free function, connect the FB L\_MFail\_1 with further signals!

#### Evaluation of the DC-bus voltage

This proceeding is used for single drives or multi-axis drives which do not use an external monitoring system.

- For evaluating the DC-bus voltage, you can use a comparator (e.g. FB [L\\_Compare\\_3](#)) as shown in the following interconnection example 1.
- In order that the mains failure control will be activated if the DC-bus voltage falls below a certain operating threshold, set the comparison function "2: In1 > In2" has to be set for the FB [L\\_Compare\\_3](#) in [C00690](#).
- For specifying the operating threshold, the SB [LS\\_ParFree\\_a\\_2](#) is used. This system block can output 16 parameterisable analog signals. In the shown example, the operating threshold has to be set in the "free parameter" [C00476/1](#).

[19-46] Interconnection example 1: Evaluation of the DC-bus voltage with a comparator (cutout)

### Use of an external monitoring system

In this proceeding, the digital status signal of an external monitoring system is connected to the FB L\_MFail\_1 via a digital input of the inverter.

- In the following example, the digital input DI7 is used.
  - The active level (HIGH or LOW active) for DI7 has to be parameterised in [C00114](#) in such a way that *bFault* becomes TRUE when the monitoring system is tripped.
  - A free input of the application block can be used to transfer the digital input signal from I/O level to application level.

[19-47] Interconnection example 2: Use of the digital status signal of an external monitoring system

### Combination of the above shown proceedings

The combination of the proceedings can be simply realised via an OR operation:

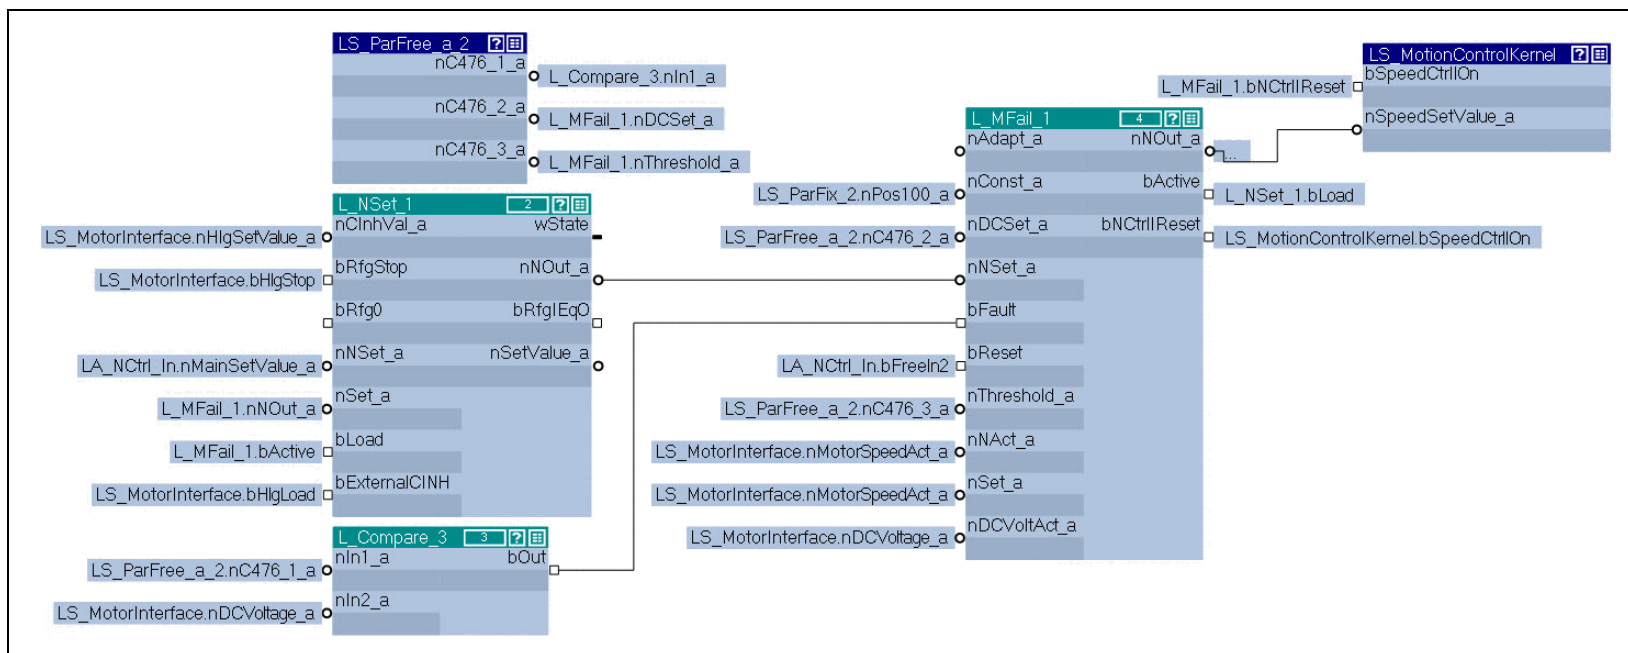

[19-48] Interconnection example 3: Mains failure control of different sources

### 19.1.106.2 Signal flow for mains failure control

The following illustration shows the basic signal flow (cutout) for a mains failure control.

The following interconnection example is not functional yet. For an error-free function, connect e.g. the FB **L NSet 1** with further signals!

[19-49] Signal flow (detail)

| L_MFail inputs | Function  |
|----------------|---|
| nAdapt_a       | Dynamic adaptation of the proportional gain of the DC-bus voltage controller.<br>• Input not interconnected → Adaptation = 0 %.                                     |

| nDCVoltAct_a   | Current DC-bus voltage  |

### 19.1.106.3 Activating the mains failure control

The mains failure control is activated by setting *bFault* to TRUE. The inverter now generates the required operational energy from the rotational energy of the drive. The drive is braked via the power loss of the inverter and the motor. Thus, the speed deceleration ramp is shorter than for an uncontrolled system (coasting drive).

#### After activating the mains failure control:

1. The acceleration time set in [C01470/2](#) is used to control the DC-bus voltage to the value at *nDCSet\_a*.
2. At *nNOOut\_a*, an internally generated speed setpoint is output which serves to brake the drive to a speed close to "0" (via the speed setpoint).
  - Starting value for the controlled deceleration is the value at *nSet\_a*. This input is appropriately connected to the actual speed value *nMotorSpeedAct\_a* of the SB [LS\\_MotorInterface](#).
  - The speed deceleration ramp (and hence the braking torque) results from the moment of inertia of the load machine(s), the power loss of the drive (system) and the set parameter setting.

#### Stop!

If a connected braking unit responds, the drive is braked with a max. possible torque ( $I_{\max}$ ). In this case, adapt the parameter setting if required (see the following chapter).

If the power section is not supplied, the drive cannot create a standstill torque (important for active loads as e.g. hoists).

#### Stopping/cancelling the mains failure control

When *bFault* is reset to FALSE, an internal timing element is triggered. After the time set in [C01470/3](#) has elapsed, the mains failure control is stopped/cancelled.

- When the restart protection is active, the drive is continued to be braked to standstill. ▶ [Restart protection](#) (□ 1649)
  - When the restart protection is active, the drive can only be reset by setting the *bReset* input to TRUE.
- When the restart protection not active, the drive is accelerated to the speed setpoint. ▶ [Quick mains recovery \(KU\)](#) (□ 1649)

#### 19.1.106.4 Parameterising the mains failure control

The parameters to be set before initial commissioning strongly depend on the used motor, the moment of inertia of the drive and the drive configuration (single drive, drive system, master/slave operation etc.) and must hence be adapted to the corresponding application case.

#### Note!

The following data refers to the chapter "[Procedure of the mains failure control](#)". (1641)

1. Measure the DC-bus voltage with an oscilloscope (channel 1).
  - Signal for the message: *nDCVoltage\_a* of the SB [LS\\_MotorInterface](#).
2. Measure the speed with an oscilloscope (channel 2).
  - Signal for the message: *nMotorSpeedAct\_a* of the SB [LS\\_MotorInterface](#).
3. Set the operating threshold for the mains failure control in [C00476/1](#).
  - Scaling: 100 %  $\equiv$  1000 V
  - Recommended setting: approx. 50 V above the reset threshold for undervoltage in the DC bus ( $LU_{off}$ ).
  - The operating thresholds for undervoltage (LU) and overvoltage (OU) depend on the setting in [C00173](#):

| Mains voltage      |            | Undervoltage (LU)                |                               | Overvoltage (OU)                 |                               |
|--------------------|------------|----------------------------------|-------------------------------|----------------------------------|-------------------------------|
| 1-phase            | C00173     | Operating threshold<br>$LU_{on}$ | Reset threshold<br>$LU_{off}$ | Operating threshold<br>$OU_{on}$ | Reset threshold<br>$OU_{off}$ |
| 230V <sub>AC</sub> | 0, 1, 2, 3 | 180 V <sub>DC</sub>              | 240 V <sub>DC</sub>           | 400 V <sub>DC</sub>              | 390 V <sub>DC</sub>           |

| Mains voltage      |        | Undervoltage (LU)                |                               | Overvoltage (OU)                 |                               |
|--------------------|--------|----------------------------------|-------------------------------|----------------------------------|-------------------------------|
| 3-phase            | C00173 | Operating threshold<br>$LU_{on}$ | Reset threshold<br>$LU_{off}$ | Operating threshold<br>$OU_{on}$ | Reset threshold<br>$OU_{off}$ |
| 400V <sub>AC</sub> | 0      | 285 V <sub>DC</sub>              | 430 V <sub>DC</sub>           | 800 V <sub>DC</sub>              | 790 V <sub>DC</sub>           |
| 440V <sub>AC</sub> | 1      | 400 V <sub>DC</sub>              | 430 V <sub>DC</sub>           |                                  |                               |
| 480V <sub>AC</sub> | 2      | 490 V <sub>DC</sub>              | 535 V <sub>DC</sub>           |                                  |                               |
| 500V <sub>AC</sub> | 3      | 540 V <sub>DC</sub>              | 585 V <sub>DC</sub>           |                                  |                               |

4. Set the voltage setpoint in [C00476/2](#) the DC-bus voltage is to be controlled to.
  - Scaling: 100 %  $\equiv$  1000 V
  - Recommended setting: approx. 700 V  $\rightarrow$  [C00476/2](#) = 70 %

#### Stop!

The voltage setpoint must be below the operating threshold of a braking unit if connected. If a connected braking unit responds, the drive with max. possible torque ( $I_{max}$ ) will be braked. The desired operational performance gets lost.

#### 19.1.106.5 Commissioning the mains failure control

Commissioning should be executed with motors without load.

1. Start the drive.

## 2. Set the acceleration time:

- Set the speed setpoint to 100 %, operate the inverter with max. speed.
- Set controller inhibit and measure deceleration time up to standstill.
- Set approx. 1/10 of the measured deceleration time in [C01470/2](#).

## 3. Set retrigger time:

- In case of mains failure control via detection of the DC-bus voltage level:  
Set the deceleration time measured under point 2 in [C01470/3](#).
- In case of mains failure control via an external system:  
Set the time in which the drive is to be continued to be brought to a standstill under control at short-term mains recovery in [C01470/3](#).

## 4. Switch off the supply voltage (mains or DC bus).

The following profile is to be shown on the oscilloscope:

[19-50] Schematic diagram with activated mains failure control (ideal profile)

| Point in time | Info               |
|---------------|--------------------|
| t = t1        | Mains failure      |
| t = t2        | Speed "0" reached. |

### 19.1.106.6 Fine adjustment of the mains failure control

For the fine adjustment, repeat the following points several times:

1. A final speed as low as possible has to be reached before the inverter reaches the operating threshold for undervoltage (LU):
  - Increase proportional gain  $V_p$  in [C01469/1](#).
  - Reduce Vdc-bus controller reset time in [C01470/1](#).
2. The responding of the braking unit or the reaching of the operating threshold for overvoltage (OU) has to be prevented:
  - Increase Vdc controller reset time in [C01470/1](#) until the ideal profile shown in [\[19-50\]](#) will be almost reached.
  - If required, reduce the  $nDcSet\_a$  voltage setpoint to which the DC-bus voltage is to be controlled (in the interconnection example via the free parameter [C00476/2](#)).
3. Increasing the deceleration time or reducing the braking torque is only possible to a limited extent:
  - Increasing the acceleration time in [C01470/2](#) reduces the initial braking torque and simultaneously increases the deceleration time.
  - Increasing the Vdc controller reset time in [C01470/1](#) reduces the braking torque and simultaneously increases the deceleration time. If the reset times are too high, the inverter reaches the operating threshold for undervoltage (LU) before standstill is reached. Hence, the drive is not controlled anymore.

[19-51] Schematic diagram with different braking torques

| Point in time | Info   |
|---------------|--|
| $t = t_1$     | Mains failure  |
| $t = t_2$     | Speed "0" with higher braking torque reached (short reset time).   |
| $t = t_3$     | With a lower braking torque (higher reset time), the drive reaches the operating threshold for undervoltage (LU) without reaching speed "0". |
| $t > t_3$     | Drive is not controlled anymore (is braked by friction).   |

**19.1.106.7 Reset mains failure control**

The mains failure control is reset by setting *bReset* to TRUE.

- A reset via *bReset* is always required when the restart protection is active or the restart protection is used and the supply (mains or DC supply) has been switched on.
- The *bReset* input can, for instance, be connected to a digital input.

**19.1.106.8 Restart protection**

The integrated restart protection is to prevent a restart in the lower speed range when the supply voltage was only interrupted briefly (mains recovery before drive stands still).

- The *nThreshold\_a* input serves to specify the restart threshold in [%] with regard to the reference speed ([C00011](#)) below which no start has to take place after mains recovery.
  - If in case of mains recovery the speed is below the restart threshold, the drive is continued to be braked in a controlled way. This function is only stopped by setting *bReset* to TRUE.
  - If the speed is above the restart threshold after mains recovery, the drive changes to its setpoint *nNSet\_a*.
  - The function is switched inactive when *nThreshold\_a* = 0 %.
- A reset takes place by setting *bReset* to TRUE and is required after every mains switching.
  - In this case, the *bActive* output is set to TRUE when the *bFault* input is set to FALSE.

**19.1.106.9 Quick mains recovery (KU)**

The quick mains recovery causes a restart of the inverter if the restart protection is not active anymore.

- In case, the drive reaches its setpoint.
- If this behaviour is not desired, you can delay the restart by setting a retrigger time in [C01470/3](#) or prevent it by using the restart protection.
- Dependent on the system, the mains recovery is reported through the mains failure control via the level of the DC-bus voltage. ▶ [Procedure of the mains failure control](#) (1641)

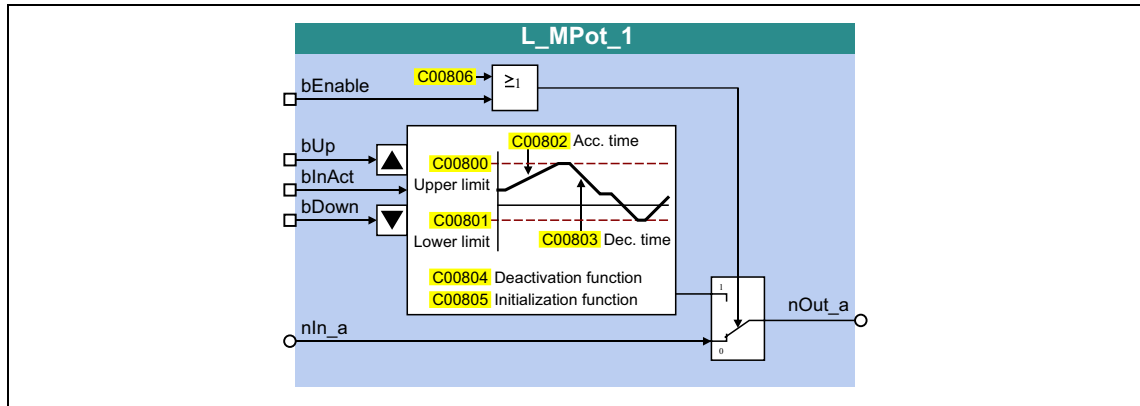

A quick mains recovery is caused by a "quick interruption" of the energy supply company (e.g. thunderstorm) and by faulty components in the supply cables (e.g. collector rings).

- Then, set the retrigger time in [C01470/3](#) higher than the measured deceleration time reached in braking operation.

## 19.1.107 L\_MPot\_1

This FB replaces a hardware motor potentiometer and can be used as an alternative setpoint source controlled via two inputs.

- The signal is output via a ramp function generator with linear ramps.
- The acceleration and deceleration times are set via parameters.
- Constant ramping even with speed limit values changed online.
- The motor potentiometer function can be switched on/off online.

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bEnable    | BOOL      | Switch over motor potentiometer function<br><i>bEnable</i> input and <a href="#">C00806</a> code are ORed.  |
|            |           | TRUE Motor potentiometer function is active, setpoint can be changed via <i>bUp</i> and <i>bDown</i> .<br>• With switching to TRUE, the value applied to <i>nIn_a</i> is automatically transferred to the motor potentiometer.  |
|            |           | FALSE The value applied to <i>nIn_a</i> is output at <i>nOut_a</i> .  |
| nIn_a      | INT       | When bEnable = FALSE, the analog nIn_ is input signal switched to the nOut_a output.  |
| bUp        | BOOL      | Approaching of the upper speed limit value set in <a href="#">C00800</a> .  |
|            |           | TRUE The <i>nOut_a</i> output signal runs to its upper limit value ( <i>nHighLimit</i> ).<br>• If the <i>bDown</i> input is simultaneously set to TRUE, the <i>nOut_a</i> output signal is not changed.                         |
| bDown      | BOOL      | Approaching of the lower speed limit value set in <a href="#">C00801</a> .  |
|            |           | TRUE The <i>nOut_a</i> output signal runs to its lower limit value ( <i>nLowLimit</i> ).<br>• If the <i>bUp</i> input is simultaneously set to TRUE, the <i>nOut_a</i> output signal is not changed.                            |
| bInAct     | BOOL      | Deactivate motor potentiometer function<br>• This input has the highest priority.<br>• When the motor potentiometer is deactivated, the <i>nOut_a</i> output signal follows the function set with code <a href="#">C00804</a> . |
|            |           | TRUE Motor potentiometer function is deactivated.   |

## outputs

### 19.1.107.1 Activate & control motor potentiometer

When *blnAct* is set to FALSE, the motor potentiometer is activated.

- The currently active function depends on the current output signal *nOut\_a*, the limit values set and the control signals at *bUp* and *bDown*.
- When the *nOut\_a* output signal is outside the limits set, the output signal runs to the next limit with the *Ti* times set. This process is independent of the control signals at *bUp* and *bDown*.
- When the *nOut\_a* output signal is inside the limits set, the output signal changes according to the control signals at *bUp* and *bDown*.

[19-52] Example: Control of the motor potentiometer

| bUp   | bDown | blnact | Function   |
|-------|-------|--------|--|
| FALSE | FALSE | FALSE  | The <i>nOut_a</i> output signal remains unchanged.   |
| TRUE  | FALSE |        | The <i>nOut_a</i> output signal runs to its upper limit value ( <i>nHighLimit</i> ).   |
| FALSE | TRUE  |        | The <i>nOut_a</i> output signal runs to its lower limit value ( <i>nLowLimit</i> ).  |
| TRUE  | TRUE  |        | The <i>nOut_a</i> output signal remains unchanged.   |
| -     | -     | TRUE   | The motor potentiometer function is deactivated. The <i>nOut_a</i> output signal responds according to the function selected via <i>Function</i> . |

### 19.1.107.2 Deactivate motor potentiometer

When the motor potentiometer is deactivated by setting *blnAct* to TRUE, the *nOut\_a* output signal responds according to the function selected via *Function*.

[19-53] Example: Deactivation of the motor potentiometer when the *Function* = 1 has been selected

19.1.108 L\_MulDiv\_1

This FB multiplies the analog input signal with a parameterisable factor.

- The value of the factor is determined by a quotient consisting of numerator and denominator .
- The value output at *nOut\_a* is limited to ±199.99 %.
- Division is not remainder considered.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn1       | INT       | Input signal                  |

outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| nOut_a     | INT       | Product value (result of the multiplication) <ul style="list-style-type: none"><li>• Internal limitation to ± 32767</li></ul> |

Parameters

| Parameters               | Possible settings |  |       | Information |
|--------------------------|-------------------|--|-------|-------------|
| <a href="#">C00699/1</a> | -32767            |  | 32767 | Meters      |
| <a href="#">C00699/2</a> | -32767            |  | 32767 | Denominator |

Function

$$nOut\_a = nIn\_a \times \frac{C00699/1}{C00699/2}$$

19.1.109 L\_MulDiv\_2

This FB multiplies the analog input signal with a parameterisable factor.

- The value of the factor is determined by a quotient consisting of numerator and denominator .
- The value output at *nOut\_a* is limited to ±199.99 %.
- Division is not remainder considered.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn1       | INT       | Input signal                  |

outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| nOut_a     | INT       | Product value (result of the multiplication) <ul style="list-style-type: none"><li>• Internal limitation to ± 32767</li></ul> |

Parameters

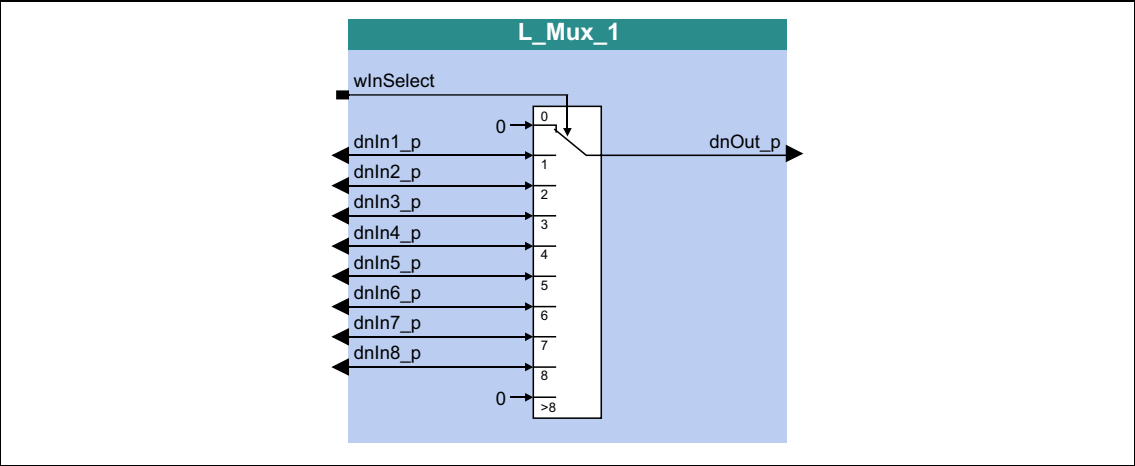

| Parameters               | Possible settings |  |       | Information |
|--------------------------|-------------------|--|-------|-------------|
| <a href="#">C00679/1</a> | -32767            |  | 32767 | Meters      |
| <a href="#">C00679/2</a> | -32767            |  | 32767 | Denominator |

Function

$$nOut\_a = nIn\_a \times \frac{C00679/1}{C00679/2}$$

19.1.110 L\_Mux\_1

This FB provides one of the eight input signals *dnIn1\_p* ... *dnIn8\_p* at the output *dnOut\_p*. The selection is made by means of the signal at the input *wInSelect*.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| wInSelect  | WORD      | Input signal  |
|            |           | 1 ... 8 <ul style="list-style-type: none"><li>• The values "1" ... "8" select the input signal to be applied to the output.</li><li>• Values from "1" ... "8" set the <i>dnOut_p</i> output to "0".</li></ul> |
| dnIn1_p    | DINT      | Input signal  |
| ...        |           |   |
| dnIn8_p    | DINT      |   |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| dnOut_p    | DINT      | Output signal |

19.1.111 L\_Negation\_1

This FB converts the sign of the input signal, i.e. the input signal is multiplied by the value -1 and is then output.

- With the value - 32768 at the *nIn\_a* input, the value + 32767 is provided at the *nOut\_a* output.

inputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nIn_a      | INT       | Input signal  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

19.1.112 L\_Negation\_2

This FB converts the sign of the input signal, i.e. the input signal is multiplied by the value -1 and is then output.

- With the value - 32768 at the *nIn\_a* input, the value + 32767 is provided at the *nOut\_a* output.

inputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nIn_a      | INT       | Input signal  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut_a     | INT       | Output signal |

## 19.1.113 L\_NLim\_1

This FB can hide up to three parameterisable blocking zones within one continuous signal characteristic.

**Note!**

A value of "0" cannot be masked out if the *nIn\_a* input signal changes signs.

**inputs**

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bEnable    | BOOL      | Activate zone masking   |
|            |           | FALSE The FB has been deactivated.<br>• The input signal is output one-to-one at the <i>nOut_a</i> output.                          |
|            |           | TRUE The FB has been activated.<br>• Zone masking of the input signal is carried out according to the parameterised blocking zones. |
| nIn_a      | INT       | Input signal  |

**outputs**

| Identifier/data type | Value/meaning   |
|----------------------|---|
| wState               | WORD  |
|                      | Bit-coded status word<br>• Bits that are not listed are reserved for future extensions.   |
|                      | Bit 0 No blocking zone active   |
|                      | Bit 1 Blocking zone 1 active  |
|                      | Bit 2 Blocking zone 2 active  |
| nOut_a               | INT   |
|                      | Output signal<br>• If the FB has been activated, the output signal is outside the blocking zones.   |
| bLimitActive         | BOOL  |
|                      | "Limitation active" status signal<br>TRUE The input signal is inside a blocking zones and is limited to the respective boundary value of the blocking zone. |

### Parameters

| Parameters                   | Possible settings |   |        | Information  |
|------------------------------|-------------------|---|--------|--|
| <a href="#">C00807/1...3</a> | 0.00              | % | 199.99 | Max. skip frequency 1 ... 3<br>• Lenze setting: 0.00 % |
| <a href="#">C00808/1...3</a> | 0.00              | % | 199.99 | Min. skip frequency 1 ... 3<br>• Lenze setting: 0.00 % |

### Definition of the blocking zones

Up to three zones can be parameterised which are to be skipped by the *nOut\_a* output signal.

The example below shows the parameter setting of two blocking zones for the L\_NLim\_1 FB:

| Parameters          | Blocking zone 1 |       | Blocking zone 2 |       | Blocking zone 3 |     |
|---------------------|-----------------|-------|-----------------|-------|-----------------|-----|
| Minimum limit value | C00808/1:       | 48 %  | C00808/2:       | 138 % | C00808/3:       | 0 % |
| Maximum limit value | C00807/1:       | 104 % | C00807/2:       | 178 % | C00807/3:       | 0 % |

[19-54] Zone masking by means of parameterisable blocking zones (in our example: L\_NLim\_1)

- The parameterised blocking zones have the same effect on negative input signals.
- A blocking zone is deactivated by entering identical limit values (in our example: blocking zone 3).

**Overlapping of blocking zones**

If blocking zones overlap, the lowest and highest value of the overlapping zones form a new zone.

In this case, the status display (*wState* output) will also just display one zone (the lower one of the two original zones).

**Abutting blocking zones**

If two blocking zones abut (e.g. 20 ... 30 % and 30 ... 40 %), the limit value between the two zones (in this example 30 %) is also passed through.

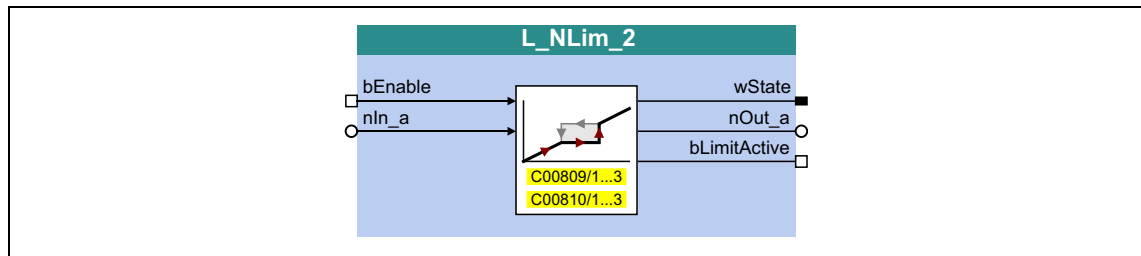

The same applies to a limit range of 0 ... xx %. At the zero crossing of the *nIn\_a* input signal, a value of "0" is also output at the *nOut\_a* output. Value "0" cannot be excluded. If the *nIn\_a* input signal drops back to "0", the *nOut\_a* output will retain the upper limit value.

## 19.1.114 L\_NLim\_2

This FB can hide up to three parameterisable blocking zones within one continuous signal characteristic.

**Note!**

A value of "0" cannot be masked out if the *nIn\_a* input signal changes signs.

**inputs**

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bEnable    | BOOL      | Activate zone masking   |
|            |           | FALSE The FB has been deactivated.<br>• The input signal is output one-to-one at the <i>nOut_a</i> output.                          |
|            |           | TRUE The FB has been activated.<br>• Zone masking of the input signal is carried out according to the parameterised blocking zones. |
| nIn_a      | INT       | Input signal  |

**outputs**

| Identifier/data type | Value/meaning   |
|----------------------|---|
| wState               | WORD  |
|                      | Bit-coded status word<br>• Bits that are not listed are reserved for future extensions.   |
|                      | Bit 0 No blocking zone active   |
|                      | Bit 1 Blocking zone 1 active  |
|                      | Bit 2 Blocking zone 2 active  |
| nOut_a               | INT   |
|                      | Output signal<br>• If the FB has been activated, the output signal is outside the blocking zones.   |
| bLimitActive         | BOOL  |
|                      | "Limitation active" status signal<br>TRUE The input signal is inside a blocking zones and is limited to the respective boundary value of the blocking zone. |

## Parameters

| Parameters                   | Possible settings |   |        | Information  |
|------------------------------|-------------------|---|--------|--|
| <a href="#">C00809/1...3</a> | 0.00              | % | 199.99 | Max. skip frequency 1 ... 3<br>• Lenze setting: 0.00 % |
| <a href="#">C00810/1...3</a> | 0.00              | % | 199.99 | Min. skip frequency 1 ... 3<br>• Lenze setting: 0.00 % |

For a detailed functional description see [L\\_NLim 1](#).

19.1.115 L\_Not\_1

This FB negates a BOOL data type signal.

inputs

**19.1.122**    **L\_NSet\_1**

This FB is used for general signal processing of process values and is provided with the following functions:

- Ramp function generator
  - With linear ramps for main and additional setpoint path
  - With S-shaped ramp (PT1 rounding)
  - Setting and holding
- Internal limitation of the input signal
- 3 adjustable blocking zones
- Arithmetic function
- 15 fixed setpoints (JOG setpoints)
- 15 acceleration and deceleration times

## inputs

| Designator      | Data type | Information/possible settings  |
|-----------------|-----------|--|
| nClnhVal_a      | INT       | Main setpoint signal which is to be accepted by the main setpoint integrator when the controller is inhibited.   |
| bRfgStop        | BOOL      | Holding (freezing) of the current value of the main setpoint integrator  |
|                 |           | TRUE The current value of the main setpoint integrator is held.  |
| bRfg0           | BOOL      | Leading the main setpoint integrator to 0 within the current Ti times  |
|                 |           | TRUE The current value of the main setpoint integrator is led to "0" within the Ti time set.   |
| bNSetInv        | BOOL      | Signal inversion for the main setpoint   |
|                 |           | TRUE Main setpoint signal is inverted.   |
| nNset_a         | INT       | Main setpoint signal<br>• Other signals are also permitted   |
| bJog1 ... bJog8 | BOOL      | Inputs for overriding fixed setpoints (JOG setpoints) for the main setpoint<br>• Selection inputs are binary coded.  |
| bTi1 ... bTi8   | BOOL      | Selection inputs for alternative acceleration/deceleration times for the main setpoint<br>• Selection inputs are binary coded.   |
| nSet_a          | INT       | Starting value which is loaded into the main setpoint integrator by setting <i>bLoad</i> to TRUE.  |
| bLoad           | BOOL      | Control of both ramp function generators in special situations, e.g. QSP   |
|                 |           | TRUE The <i>nSet_a</i> input signal is loaded into the main setpoint integrator and the additional setpoint integrator is set to "0".  |
| bAddInv         | BOOL      | Signal inversion for the additional setpoint   |
|                 |           | TRUE Additional setpoint signal is inverted.   |
| nNAdd_a         | INT       | Additional setpoint signal<br>• Other signals are also permitted   |
| bExternalCINH   | BOOL      | Additional load input for the main setpoint integrator and the additional setpoint integrator  |
|                 |           | TRUE The main setpoint integrator is set to the value applied at <i>nClnhVal_a</i> .<br>The additional setpoint integrator is set to "0".<br>► <a href="#">Application example for the additional load function</a> (1678) |

## outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| nNOut_a    | INT       | Speed setpoint output signal<br>• Scaling: 16384 $\equiv$ 100 %            |
| bRfgIEQO   | BOOL      | Status signal "setpoint before ramp = setpoint after ramp (ramp inactive)" |

| Designator  | Data type | Value/meaning   |
|-------------|-----------|---|
| wState      | WORD      | Bit-coded status word <ul style="list-style-type: none"> <li>Bits that are not listed are reserved for future extensions.</li> </ul>                  |
|             |           | Bit 0 No blocking zone active   |
|             |           | Bit 1 Blocking zone 1 active  |
|             |           | Bit 2 Blocking zone 2 active  |
|             |           | Bit 3 Blocking zone 3 active  |
|             |           | Bit 4 Jog in blocking zone  |
|             |           | Bit 5 MaxLimit active   |
|             |           | Bit 6 MinLimit active   |
| nSetValue_a | INT       | Speed-setpoint input signal of the ramp function generator <ul style="list-style-type: none"> <li>Scaling: 16384 <math>\equiv</math> 100 %</li> </ul> |

### Parameters

| Parameters                   | Possible settings |                                      |         | Information   |
|------------------------------|-------------------|--------------------------------------|---------|---|
| <a href="#">C00012</a>       | 0.000             | s                                    | 999.900 | Acceleration time $T_{ir}$ for the main setpoint<br>• Lenze setting: 0.000 s  |
| <a href="#">C00013</a>       | 0.000             | s                                    | 999.900 | Deceleration time $T_{if}$ for the main setpoint<br>• Lenze setting: 0.000 s  |

### 19.1.122.1 Main setpoint path

- The signals in the main setpoint path are limited to a value range of  $\pm 32767$ .
- The signal at *nNSet\_a* is first led via the JOG selection function.
- A selected JOG value switches the *nNSet\_a* input inactive. Then, the subsequent signal conditioning operates with the JOG value.

### 19.1.122.2 JOG setpoints

In addition to the direct main setpoint selection via the *nNSet\_a* input, so-called JOG setpoints can be preset in [C00039/1...15](#).

- The JOG setpoints are binary-coded and can be called using the *bJog1* ... *bJog8* selection inputs so that 15 options are available:

| Selection inputs |              |              |              | Main setpoint<br>Main setpoint |
|------------------|--------------|--------------|--------------|--------------------------------|
| <i>bJog8</i>     | <i>bJog4</i> | <i>bJog2</i> | <i>bJog1</i> |                                |
| FALSE            | FALSE        | FALSE        | FALSE        | <i>nNset_a</i>                 |
| FALSE            | FALSE        | FALSE        | TRUE         | <a href="#">C00039/1</a>       |
| FALSE            | FALSE        | TRUE         | FALSE        | <a href="#">C00039/2</a>       |
| FALSE            | FALSE        | TRUE         | TRUE         | <a href="#">C00039/3</a>       |
| FALSE            | TRUE         | FALSE        | FALSE        | <a href="#">C00039/4</a>       |
| FALSE            | TRUE         | FALSE        | TRUE         | <a href="#">C00039/5</a>       |
| FALSE            | TRUE         | TRUE         | FALSE        | <a href="#">C00039/6</a>       |
| FALSE            | TRUE         | TRUE         | TRUE         | <a href="#">C00039/7</a>       |
| TRUE             | FALSE        | FALSE        | FALSE        | <a href="#">C00039/8</a>       |
| TRUE             | FALSE        | FALSE        | TRUE         | <a href="#">C00039/9</a>       |
| TRUE             | FALSE        | TRUE         | FALSE        | <a href="#">C00039/10</a>      |
| TRUE             | FALSE        | TRUE         | TRUE         | <a href="#">C00039/11</a>      |
| TRUE             | TRUE         | FALSE        | FALSE        | <a href="#">C00039/12</a>      |
| TRUE             | TRUE         | FALSE        | TRUE         | <a href="#">C00039/13</a>      |
| TRUE             | TRUE         | TRUE         | FALSE        | <a href="#">C00039/14</a>      |
| TRUE             | TRUE         | TRUE         | TRUE         | <a href="#">C00039/15</a>      |

- The number of selection inputs to be assigned depends on the number of JOG setpoints required:

| Number of JOG setpoints required | Number of selection inputs to be assigned ( <i>bJog1</i> ... <i>bJog8</i> ) |
|----------------------------------|---|
| 1                                | At least 1  |
| 2 ... 3                          | at least 2  |
| 4 ... 7                          | at least 3  |
| 8 ... 15                         | 4   |

#### 19.1.122.3 Setpoint inversion

The output signal of the JOG function is led via an inverter.

The sign of the setpoint changes if *bNSetInv* is set to TRUE.

#### 19.1.122.4 Value range of the input signal

The value range of the input signal can be limited by using the following parameters:

- [C00635](#): MaxLimit (default setting: +199.99 %)
- [C00636](#): MinLimit (default setting: -199.99 %)

#### 19.1.122.5 Skip frequency function

If the speed setpoints in speed-variable drives are linearly increasing, for instance, the frequency/speed range is divided into a number of equal time segments. Therefore, there may be speeds during acceleration time which must be bridged very fast (e.g. natural resonant frequencies).

The skip frequency function offers the opportunity to select a range in which the initial speed is maintained. If the speed setpoint leaves that range, the drive will be accelerated to reach the desired speed.

#### Note!

- Blocking frequencies act on the main setpoint only.
- It is not possible to exclude "0" speed if there is a sign reversal of the speed setpoint.

### Definition of the blocking zones

The subcodes of codes [C00632](#) and [C00633](#) can be used to define three zones which are to be skipped by the output setpoint and which are to be passed as fast as possible by the ramp function generator.

The example below shows the parameter setting of two blocking zones:

| Parameters          | Blocking zone 1 | Blocking zone 2 | Blocking zone 3 |
|---------------------|-----------------|-----------------|-----------------|
| Minimum limit value | C00633/1: 48 %  | C00633/2: 138 % | C00633/3: 0 %   |
| Maximum limit value | C00632/1: 104 % | C00632/2: 178 % | C00632/3: 0 %   |

[19-55] Zone masking by means of parameterisable blocking zones

- The parameterised blocking zones have the same effect on negative input signals.
- A blocking zone is deactivated by entering identical limit values (in our example: blocking zone 3).

### Overlapping of blocking zones

If blocking zones overlap, the lowest and highest value of the overlapping zones form a new zone. In this case, the status display (output *wState* or display parameter [C00634](#)) only indicates one zone (the lower of the two original zones).

### Abutting blocking zones

If two blocking zones abut (e.g. 20 ... 30 % and 30 ... 40 %), the limit value between the two zones (in this example 30 %) is also passed through.

The same applies to a limit range of 0 ... xx %. During zero crossing of the speed setpoint, "0" speed is output as setpoint. It is possible to exclude "0" speed. However, in this case, the output speed will remain on the upper limit value when the input setpoint becomes "0".

#### Tip!

As described above, the acceleration phase starts after the blocking zones have been passed through. The ramp function generator integrated in the **L\_Nset** function block limits the progression of the speed. For this reason, the time values set for the integrated ramp function generator should be as low as possible whereas the setpoint for the **L\_Nset** function block should be generated by a ramp function generator with higher time values (e.g. **L\_MPot** function block).

#### 19.1.122.6 Ramp function generator for the main setpoint

The setpoint is now led via a ramp function generator with linear characteristic. The ramp function generator converts setpoint step-changes at the input into a ramp.

[19-56] Acceleration and deceleration times

- $t_{ir}$  and  $t_{if}$  are the desired times for changing between  $w1$  and  $w2$ .
- S-ramps are possible by selecting S-ramp times.
- The  $t_{ir}/t_{if}$  values are converted into the required  $T_i$  times according to the following formula:

$$T_{ir} = t_{ir} \cdot \frac{100\%}{w2 - w1}$$

$$T_{if} = t_{if} \cdot \frac{100\%}{w2 - w1}$$

### Setting and selection of Ti times

Via parameters, you can select 16 different Tir and Tif times each for the ramp function generator.

- The selection is made via the binary coded selection inputs *bTI1* ... *bTI8*:

| Selection inputs |             |             |             | Used Acceleration time    | Used Deceleration time    |
|------------------|-------------|-------------|-------------|---------------------------|---------------------------|
| <i>bTI8</i>      | <i>bTI4</i> | <i>bTI2</i> | <i>bTI1</i> |                           |                           |
| FALSE            | FALSE       | FALSE       | FALSE       | <a href="#">C00012</a>    | <a href="#">C00013</a>    |
| FALSE            | FALSE       | FALSE       | TRUE        | <a href="#">C00101/1</a>  | <a href="#">C00103/1</a>  |

### Function

- When the controller is inhibited (CINH), the ramp function generator accepts the value applied at *nCInhVal\_a* and transfers it to the downstream function. This function has priority over all other functions.
- bRfgStop* = TRUE
  - The ramp function generator is stopped. Changes at the input of the ramp function generator have no effect on the output signal.
- bRfg0* = TRUE
  - The ramp function generator runs to 0 along its deceleration ramp.
- Furthermore it is possible to load the ramp function generator online with a defined value. For this purpose, *bLoad* must be set to TRUE. As long as this input is set, the value at *nSet\_a* is transferred to the ramp function generator and provided at the output.

**Priorities:**

| CINH  | bLoad | bRfg0 | bRfgStop | Function   |
|-------|-------|-------|----------|--|
| FALSE | FALSE | FALSE | FALSE    | The ramp function generator follows the input value via the set ramps.   |

**19.1.122.7 S-ramp**

A PT1 element is connected downstream of the linear ramp function generator. This arrangement implements an S-shaped ramp for a nearly jerk-free acceleration and deceleration.

- The PT1 element can be switched on/off via the *bSShapeActive* input.
- The corresponding S-ramp time can be set under [C00182](#).

### 19.1.122.8 Additional setpoint

Use the *nNAdd\_a* input to define an additional value (e.g. a correcting signal) and combine it arithmetically with the main setpoint *nNSet\_a*.

- First, the additional setpoint is led via a ramp function generator with linear characteristic. Its Ti times can be set in [C00220](#) (acceleration time) and [C00221](#) (deceleration time).
- When the input *bNAddInv* is set to TRUE, the additional setpoint can be inverted before having an effect on the ramp function generator.
- When the input *bLoad* is set to TRUE, the ramp function generator is set to zero for the additional setpoint and held there without considering the Ti times. The same applies when the controller is inhibited.
- The following arithmetic combination of main setpoint and additional setpoint can be selected in [C00190](#):

| Value in C00190 | Function   | Info  |
|-----------------|--|---|
| 0               | $nNOut\_a = nNSet\_a$                                  | The additional setpoint <i>nNAdd_a</i> is not processed.          |
| 1               | $nNOut\_a = nNSet\_a + nNAdd\_a$                       |   |
| 2               | $nNOut\_a = nNSet\_a - nNAdd\_a$                       |   |
| 3               | $nNOut\_a = (nNSet\_a * nNAdd\_a) / 100 \%$            | Internal scaling:<br>• 100 % $\equiv$ 16384<br>• 1 % $\equiv$ 164 |
| 4               | $nNOut\_a = (nNSet\_a * 1 \%) /  nNAdd\_a $            |   |
| 5               | $nNOut\_a = (nNSet\_a * 100 \%) / (100 \% - nNAdd\_a)$ |   |

### 19.1.122.9 Application example for the additional load function

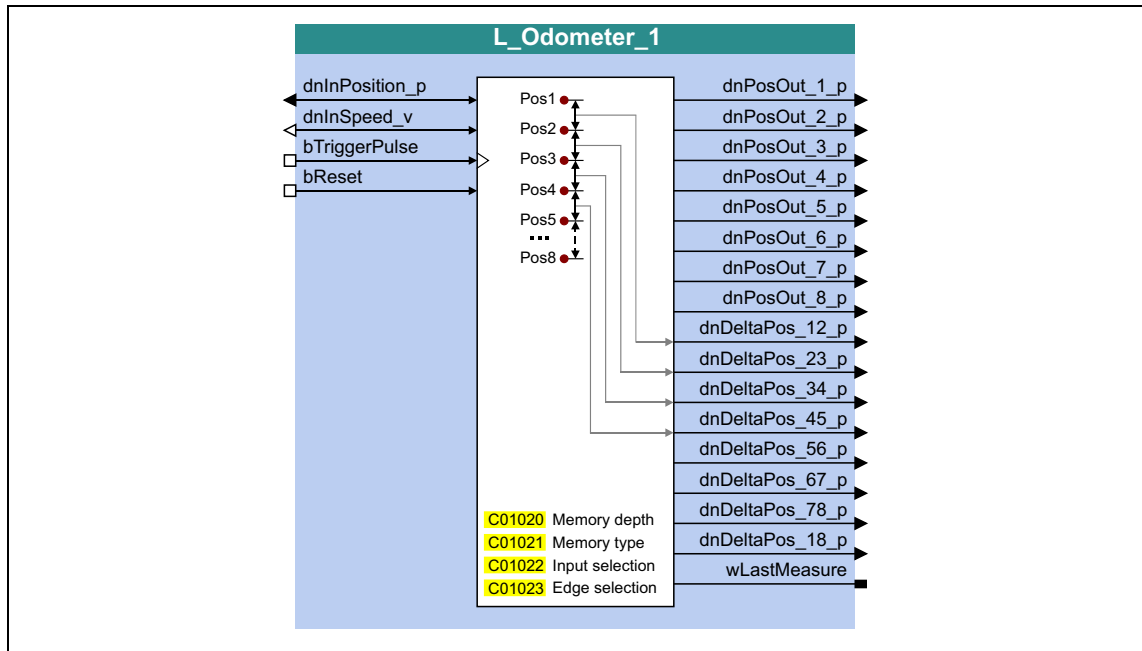

The motor control of the drive is provided with a function for automatically carrying along ramp function generators for "jerk-free" setpoint connection. For speed-controlled drive tasks, the [LS\\_MotorInterface](#) SB outputs the current actual speed value via the *nHlgSetValue\_a* output (e.g. in case of a pulse inhibit, flying restart, controller inhibit).

- In case of a pulse inhibit, the main setpoint generator must be carried along with the current actual speed value to ensure jerk-free setpoint transfer.
- The actual speed value is carried along automatically if the following wiring is provided:
  - [LS\\_MotorInterface.nHlgSetValue\\_a](#)  $\rightarrow$  [L\\_NSet\\_1.nClnhValue\\_a](#)
  - [LS\\_MotorInterface.bHlgLoad](#)  $\rightarrow$  [L\\_NSet\\_1.bExternalCINH](#)

## 19.1.123 L\_Odometer\_1

This FB can be used to record positions and calculate distances.

- Depending on the input selection set in [C01022](#), a position signal can be detected at the *dnInPosition\_p* input or a speed can be detected at the *nInSpeed\_v* input.
- The position is detected/accepted via the edge selected in [C01023](#) at the *bTriggerPulse* input.
- If "Ring buffer" is selected in [C01021](#), the measurement will start all over again after the number of measurements selected in [C01020](#) has been performed and the old values will be overwritten. Otherwise, the measurement will stop.

## inputs

| Designator     | Data type | Information/possible settings   |
|----------------|-----------|---|
| dnInPosition_p | DINT      | Position measurement input <ul style="list-style-type: none"> <li>• Input is only evaluated if <a href="#">C01022</a> = "0: Pos input" has been set.</li> </ul>   |
| nInSpeed_v     | INT       | Speed measurement input <ul style="list-style-type: none"> <li>• The speed is internally integrated into a position.</li> <li>• Input is only evaluated if <a href="#">C01022</a> = "1: V input" has been set.</li> </ul> |
| bTriggerPulse  | BOOL      | Detect position/speed <ul style="list-style-type: none"> <li>• The tripping edge can be parameterised in <a href="#">C01023</a>.</li> </ul>   |
| bReset         | BOOL      | Reset measurement results and internal integrator   |
|                | TRUE      | Reset measurement results and internal integrator.  |

### outputs

19.1.124 L\_OffsetGain\_1

This FB can add an offset to an analog input signal and amplify it afterwards. Preferably to be interconnected directly after the analog input terminals.

- The internal calculations (addition and subtraction) are carried out with 32 bits without overflow/underflow. Division is not remainder considered.
- Offset and gain are selected via FB inputs.
- The value provided at the *nOut\_a* output is internally limited to ±199.99 %.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nIn_a      | INT       | Input signal <ul style="list-style-type: none"><li>• Scaling: 16384 ≙ 100 %</li></ul>                       |

[19-62] Truth table of the FB L\_Or5\_2

## 19.1.138 L\_PCTRL\_1

This FB is a PID controller and can be used for various control tasks (e.g. as dancer position controller, tension controller, or pressure controller).

The FB is provided with the following functions:

- Adjustable control algorithm (P, PI, PID)
- Ramp function generator for preventing setpoint step-changes at the input
- Limitation of the controller output
- Factorisation of the output signal
- Vp adaptation
- Integral action component can be switched off
- Comparison function "Actual value = setpoint"

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nAdapt_a   | INT       | <p>Percentage adaptation of the gain Vp set in <a href="#">C00222</a> and the reset time Tn set in <a href="#">C00223</a>.</p> <p>Then, the adapted reset time is as follows:</p> $T_n = \frac{V_{pC222} \cdot nAdapt\_a [\%] \cdot T_{nC223} [ms]}{100 [\%]}$ <ul style="list-style-type: none"> <li>• Internal limitation to <math>\pm 199.99 \%</math></li> <li>• Changes can be done online.</li> <li>• Display parameter: <a href="#">C00830/62</a></li> </ul> |
| nNset_a    | INT       | <p>Speed setpoint</p> <ul style="list-style-type: none"> <li>• Scaling: <math>16384 \equiv 100 \%</math></li> <li>• Internal limitation to <math>\pm 199.99 \%</math></li> <li>• Display parameter: <a href="#">C00830/89</a></li> </ul>  |

| Designator           | Data type | Information/possible settings   |  |
|----------------------|-----------|---|--|
| nSet_a               | INT       | Sensor and process setpoint for operating modes 2, 4 and 5 <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li><li>• Internal limitation to ± 199.99 %</li><li>• Display parameter: <a href="#">C00830/63</a></li></ul>  |  |
| nAct_a               | INT       | Speed or actual sensor value (actual process value) <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li><li>• Internal limitation to ± 199.99 %</li><li>• Display parameter: <a href="#">C00830/61</a></li></ul>   |  |
| bInAct               | BOOL      | Deactivate process controller temporarily (stop) <ul style="list-style-type: none"><li>• Changes can be done online.</li><li>• Display parameter: <a href="#">C00833/76</a></li></ul> Note: This input is not interconnected in the LA_NCtrl application block.   |  |
|                      |           | TRUE  | <ul style="list-style-type: none"><li>• The current output value is frozen.</li><li>• The internal control algorithm is stopped.</li><li>• However, a setpoint selected via input <i>nNSet_a</i> is still provided in operating modes 0/1/4/5.</li></ul> |
| bIOff                | BOOL      | Switch off the I-component of the process controller <ul style="list-style-type: none"><li>• Changes can be done online.</li><li>• Display parameter: <a href="#">C00833/77</a></li></ul>   |  |
|                      |           | TRUE  | The I component of the process controller is set to zero.  |
| nInfluence_a         | INT       | Limitation of the influencing factor in percent <ul style="list-style-type: none"><li>• <i>nInfluence_a</i> serves to limit the influencing factor of the PID controller contained in the FB to a required value (- 199.99 % ... + 199.99 %).</li><li>• Scaling: 16384 ≡ 100 %</li><li>• Internal limitation to ± 199.99 %</li><li>• Display parameter: <a href="#">C00830/64</a></li></ul> |  |
| bEnableInfluenceRamp | BOOL      | Activate ramp for influencing factor <ul style="list-style-type: none"><li>• Display parameter: <a href="#">C00833/106</a></li></ul>  |  |
|                      |           | TRUE  | Influencing factor of the PID controller is ramped up to the <i>nInfluence_a</i> value.  |
|                      |           | FALSE   | Influencing factor of the PID controller is ramped down to "0".  |
| bISet                | BOOL      | Accept I component <i>nISet_a</i> in PID controller   |  |
|                      |           | TRUE  | The value at the input <i>nISet_a</i> is accepted in the PID controller.   |
| nISet_a              | INT       | Selection of I component of PID controller <ul style="list-style-type: none"><li>• With a TRUE signal at <i>bISet</i>, the assigned value is accepted in the PID controller.</li><li>• Scaling: 16384 ≡ 100 %</li><li>• Internal limitation to ± 199.99 %</li></ul>   |  |
| bPIDOff              | BOOL      | Reset the entire PID controller   |  |
|                      |           | TRUE  | <ul style="list-style-type: none"><li>• The I component of the controller is set to zero.</li><li>• The controller output is set to zero.</li><li>• The internal control algorithm is stopped.</li></ul>   |

## outputs

| Designator      | Data type | Value/meaning   |

**19.1.138.1 Control characteristic**

The PI algorithm is active in the Lenze setting.

**Gain (P component)**

The input value is controlled by a linear characteristic. The slope of the characteristic is determined by the controller gain Vp.

The controller gain Vp is set under [C00222](#).

- The controller gain can be adapted via the input *nAdapt\_a* (also possible in online mode).
- The input value *nAdapt\_a* has a direct effect on the controller gain:

$$P = nAdapt\_a \cdot C00222$$

Example: With the parameterised controller gain Vp = 2.0 and *nAdapt\_a* = 75 %, the resulting gain factor is as follows:

$$P = \frac{75 [\%]}{100 [\%]} \cdot 2.0 = 1.5$$

**Integral action component (I component)**

The I component can be selected via the input *nISet\_a*. With a TRUE signal at *bISet*, the assigned value is accepted in the PID controller.

- Setting the adjustment time Tn to the maximum value of "6000 ms" deactivates the I component.
- The I component of the controller can also be deactivated by setting the input *bIOff* to TRUE.
- The I component can be switched on and off online.

**Reset time**

The adjustment time Tn is set under [C00223](#).

**Differential component Kd (D component)**

The differential component Kd is set under [C00224](#).

- The setting "0.0 s" deactivates the D component (Lenze setting). In this way, the PID controller becomes a PI controller or P controller, if the I component has been deactivated as well.

### 19.1.138.2 Ramp function generator

The PID output is led via a ramp function generator with linear characteristic. This serves to transfer setpoint step-changes at the PID output into a ramp which should be as steep as possible.

[19-63] Acceleration and deceleration times

- $t_{ir}$  and  $t_{if}$  are the desired times for changing between  $w1$  and  $w2$ .
- The ramps for acceleration and deceleration can be set individually.
  - [C00227](#): Acceleration time  $t_{ir}$
  - [C00228](#): Deceleration time  $t_{if}$
- The  $t_{ir}/t_{if}$  values are converted into the required  $T_i$  times according to the following formula:

|   |   |
|---|---|
| $T_{ir} = t_{ir} \cdot \frac{100\%}{w2 - w1}$ | $T_{if} = t_{if} \cdot \frac{100\%}{w2 - w1}$ |
|---|---|

- The ramp function generator is immediately set to "0" by setting *blnAct* to TRUE.

### 19.1.138.3 Operating range of the PID process controller

The value range of the input signal *nSet\_a* and thus the operating range of the PID process controller can be limited with the following parameters:

- [C00231/1](#): Pos. maximum (default setting: 199.99 %)
- [C00231/2](#): Pos. minimum (default setting: 0.00 %)
- [C00231/3](#): Neg. minimum (default setting: 0.00 %)
- [C00231/4](#): Neg. maximum (default setting: 199.99 %)

#### 19.1.138.4 Evaluation of the output signal

After the limitation, the output signal is evaluated with the influencing factor *nInfluence\_a*. The evaluation is activated/suppressed along a ramp when the *bEnableInfluenceRamp* input is set to TRUE. The ramp times are set with the parameters "Influence acceleration time" ([C00243](#)) and "Influence deceleration time" ([C00244](#)).

#### 19.1.138.5 Comparison function "Actual value = setpoint"

If setpoint and actual value are identical and there is no system deviation, the *bSetEqAct* status output is set to TRUE.

- The hysteresis of the comparison function has a fixed value of 1 %.
- The symmetrical window around the setpoint for the comparison function can be set in [C00247](#) (Lenze setting: 2 %).

[19-64] Comparison function: Switching performance

[19-65] Comparison function: Example

### 19.1.138.6 Control functions

The process controller has various digital inputs for controlling the FB:

| Designator | Data type | Information/possible settings  |
|------------|-----------|--|

**19.1.139 L\_PhaseDiff\_1**

This FB generates a position difference for the specified position setpoint from a position value and a speed signal.

- In an integrator, the *nIn\_v* speed signal is integrated into a position value and subtracted from the *dnSet\_p* position setpoint.
- In addition, the adaptive *dnAdd\_p* position value can be added to the integrator content by setting *bEn* to TRUE.

**inputs**

| Designator | Data type | Information/possible settings   |  |
|------------|-----------|---|--|
| dnSet_p    | DINT      | Selection of a position setpoint                                      |  |

## 19.1.141 L\_PhaseIntK\_1

This FB can integrate a speed or a velocity to an angle (path). The FB can also detect a relatively completed distance.

- The integrator can take max.  $\pm 32000$  encoder revolutions.

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nIn_v      | INT       | Selection of the actual speed<br>• 16384 $\equiv$ 15000 rpm   |
| bLoad      | BOOL      | Load angle integrator with starting value and reset status signal<br>TRUE Angle integrator is loaded with the value at <i>dnSet_p</i> and <i>bStatus</i> is reset to FALSE. |
| dnSet_p    | DINT      | Starting value for angle integrator   |

## outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| dnOut_p    | DINT      | Angle output signal<br>• 65536 [incr.] $\equiv$ 1 encoder revolution<br>• Overflow is possible (display via <i>bStatus</i> )                                    |
| bStatus    | BOOL      | Status signal "Overflow occurred/distance processed"<br>• Status signal can be reset via <i>bLoad</i> .<br>TRUE Overflow has occurred or distance is processed. |

## Parameters

| Parameters               | Possible settings            | Information  |
|--------------------------|------------------------------|--|
| <a href="#">C01150/1</a> |                              | Function   |
|                          | 0 Loading with level         | Load integrator with TRUE level at the input <i>bLoad</i> (Lenze setting)                                |
|                          | 1 Loading with edge          | Load integrator with FALSE/TRUE edge at the input <i>bLoad</i> .   |
|                          | 2 Loading with level + reset | Load integrator when reaching the comparison value or with TRUE level at the input <i>bLoad</i> .        |
| <a href="#">C01151/1</a> | 0                            | Comparison value<br>• Is valid for both the positive and the negative value range.<br>• Lenze setting: 0 |

### 19.1.141.1 Function at constant input value

Selection: [C01150](#) = "0: Loading with level" or "1: Loading with edge"

[19-66] Switching performance if the overflow is in the positive direction

- If "0: Loading with level" is selected in [C01150](#), the *bLoad* input is status-controlled: In case of a TRUE signal, the integrator is loaded with the value at *dnSet\_p* and the *bStatus* output is set to FALSE.
- If "1: Loading with edge" is selected in [C01150](#), the *bLoad* input is edge-controlled: In case of a FALSE/TRUE edge, the integrator is loaded with the value at *dnSet\_p* and then immediately continues to integrate, the *bStatus* output is set to FALSE.
- A positive signal at *nIn\_v* is incremented (the counter content is increased with every function call).
- A negative signal at *nIn\_v* is decremented (the counter content is reduced with every function call).
- *dnOut\_p* outputs the counter content of the bipolar integrator.
  - If the counter content exceeds a value of +32767 encoder revolutions (corresponds to +2147483647 incr.), an overflow occurs and the counting process continues at a value of -32768 encoder revolutions.
  - If the counter content falls below a value of -32768 encoder revolutions (corresponds to -2147483648 incr.), an overflow occurs and the counting process starts at a value of +32767 encoder revolutions.
- *bStatus* will be set to TRUE if the comparison value set in [C01151/x](#) is reached.

### 19.1.141.2 Function at input value with sign reversal

Selection: [C01150](#) = "2: Loading with level + reset"

[19-67] Switching performance if the input signal changes signs

- If "2: Loading with level + reset" is selected in [C01150](#), the *bLoad* input is status-controlled: In case of a TRUE signal, the integrator is loaded with the value at *dnSet\_p* and the *bStatus* output is set to FALSE.
- A positive signal at *n/n\_v* is incremented (the counter content is increased with every function call).
- A negative signal at *n/n\_v* is decremented (the counter content is reduced with every function call).
- *dnOut\_p* outputs the counter content of the bipolar integrator.
  - If the positive counter content is higher than the comparison value set in [C01151/x](#), the comparison value will be subtracted from the counter content, and *bStatus* will be set to TRUE for one task cycle.
  - If the negative counter content is lower than the comparison value set in [C01151/x](#), the comparison value will be added to the counter content, and *bStatus* will be set to TRUE for one task cycle.

**19.1.141.3 Calculation of the output signal**

The output value at  $dnOut\_p$  can be detected according to the following formula:

$$dnOut\_p [incr.] = nIn\_v [rpm] \cdot t [s] \cdot 65535 [incr./rev.]$$

$t$  = integration time  
 $16384 \approx 15000$  rpm  
 $1 \approx 1$  incr.

**Example**

You want to determine the counter content of the integrator at a certain speed at the input and a certain integration time  $t$ .

Given values:

- $nIn\_v = 1000$  rpm  $\approx$  integer value 1092
- Integration time  $t = 10$  s
- Starting value of the integrator = 0

Solution:

- Conversion of the input signal at  $nIn\_v$ :

$$1000 \text{ rpm} = \frac{1000 \text{ rev.}}{60 \text{ s}}$$

- Calculation of the output value:

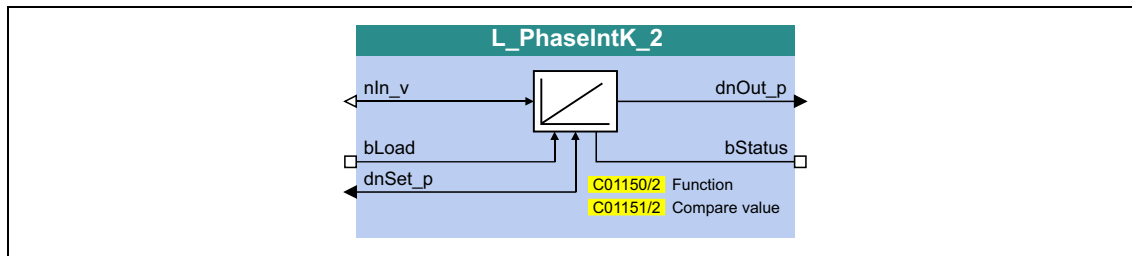

$$dnOut\_p = \frac{1000 \text{ rev.}}{60 \text{ s}} \cdot 10 \text{ s} \cdot \frac{65535 \text{ incr.}}{\text{Rev.}} = 10922666 \text{ incr.}$$

## 19.1.142 L\_PhaseIntK\_2

This FB can integrate a speed or a velocity to an angle (path). The FB can also detect a relatively completed distance.

- The integrator can take max.  $\pm 32000$  encoder revolutions.

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nIn_v      | INT       | Selection of the actual speed<br>• 16384 $\equiv$ 15000 rpm   |
| bLoad      | BOOL      | Load angle integrator with starting value and reset status signal<br>TRUE Angle integrator is loaded with the value at <i>dnSet_p</i> and <i>bStatus</i> is reset to FALSE. |
| dnSet_p    | DINT      | Starting value for angle integrator   |

## outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| dnOut_p    | DINT      | Angle output signal<br>• 65536 [incr.] $\equiv$ 1 encoder revolution<br>• Overflow is possible (display via <i>bStatus</i> )                                    |
| bStatus    | BOOL      | Status signal "Overflow occurred/distance processed"<br>• Status signal can be reset via <i>bLoad</i> .<br>TRUE Overflow has occurred or distance is processed. |

## Parameters

| Parameters               | Possible settings            | Information  |
|--------------------------|------------------------------|--|
| <a href="#">C01150/2</a> |                              | Function   |
|                          | 0 Loading with level         | Load integrator with TRUE level at the input <i>bLoad</i> (Lenze setting)                                |
|                          | 1 Loading with edge          | Load integrator with FALSE/TRUE edge at the input <i>bLoad</i> .   |
|                          | 2 Loading with level + reset | Load integrator when reaching the comparison value or with TRUE level at the input <i>bLoad</i> .        |
| <a href="#">C01151/2</a> | 0                            | Comparison value<br>• Is valid for both the positive and the negative value range.<br>• Lenze setting: 0 |

For a detailed functional description see [L\\_PhaseIntK\\_1](#).

19.1.143 L\_PhiAdd\_1

This FB adds or subtracts angle signals depending on the input used.

- The value provided at the *dnOut\_p* output is internally limited to  $\pm 2147483647$  ( $\pm 2^{31} - 1$ ).
- The value provided at the *dnOut2\_p* output is not limited internally, this enables an internal overflow.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| dnIn1_p    | DINT      | Input signal 1                |
| dnIn2_p    | DINT      | Input signal 2 (addition)     |
| dnIn3_p    | DINT      | Input signal 3 (subtraction)  |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| dnOut_p    | DINT      | Output signal <ul style="list-style-type: none"><li>• Internal limitation to <math>\pm 2147483647</math></li></ul>                       |
| dnOut2_p   | DINT      | Output signal 2 <ul style="list-style-type: none"><li>• Without limitation/with overflow (which makes a wrong output possible)</li></ul> |

Function

$$dnOut\_p = dnIn1\_p + dnIn2\_p - dnIn3\_p$$

19.1.144 L\_PhiDiv\_1

This FB divides or multiplies angle signals in power of two format.

- A positive division factor ([C01012/1](#)) causes a division.
- A negative division factor ([C01012/1](#)) causes a multiplication.
- The value provided at the *dnOut\_p* output is internally limited to  $\pm 2^{31} - 1$ .
- Division is not remainder considered.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| dnIn_p     | DINT      | Input signal                  |

outputs

| Designator | Data type | Value/meaning  |
|------------|-----------|--|
| dnOut_p    | DINT      | Output signal<br>• Internal limitation to $\pm 2^{31} - 1$ |

Parameters

| Parameters               | Possible settings |  |    | Information                           |
|--------------------------|-------------------|--|----|---------------------------------------|
| <a href="#">C01012/1</a> | -31               |  | 31 | Division factor<br>• Lenze setting: 0 |

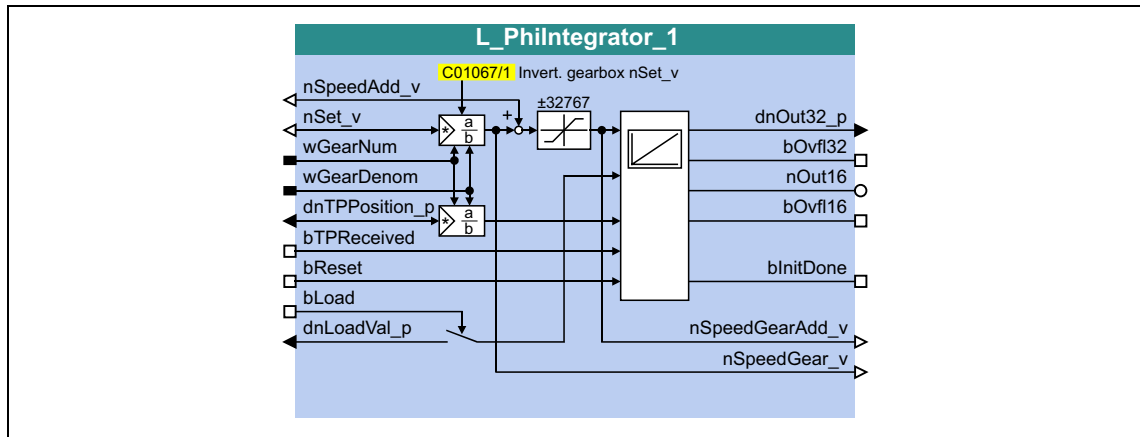

Function

$$dnOut\_p = dnIn\_p \cdot \frac{1}{2^{C01012/1}}$$

## 19.1.145 L\_PhilIntegrator\_1

This FB evaluates a speed with a gearbox factor and adds them in an integrator.

- The integrator value is output as 16-bit value and 32-bit value.
- An overflow of the prevailing output is signalled.
- The integrator can be loaded and initialised (e.g. with a touch probe signal).

## inputs

| Designator     | Data type | Information/possible settings   |  |
|----------------|-----------|---|--|
| nSpeedAdd_v    | INT       | Additive speed  |  |
| nSet_v         | INT       | Speed input (angular difference)  |  |
| wGearNum       | WORD      | Gearbox factor (numerator)  |  |
| wGearDenom     | WORD      | Gearbox factor (denominator)<br>• When <i>wGearDenom</i> = 0, it is internally calculated with 1. |  |
| dnTPPosition_p | DINT      | Initialisation value  |  |
| bTPReceived    | BOOL      | Initialise integrator   |  |
|                |           | FALSE/TRUE  | Initialise integrator  |
| bReset         | BOOL      | Reset integrator  |  |
|                |           | TRUE  | Reset integrator<br>• The integrator is not integrated.  |

|                          | 1   Inverted               |                        |
|                          | 2   Automatically from MCK |                        |

### 19.1.145.1 Function

The  $nSet\_v$  input value is evaluated, integrated and output as 16-bit value ( $nOut16$ ) and 32-bit value  $dnOut32\_p$  with the gearbox factors  $wGearNum$  and  $wGearDenom$ .

$$nOut16 = nOut16 + nSet\_v \cdot \frac{wGearNum}{wGearDenom}$$

$$dnOut32\_p = dnOut32\_p + nSet\_v \cdot \frac{wGearNum}{wGearDenom}$$

- Evaluation of the gearbox factor is remainder considered.
- A positive or negative overflow of the integrator is signalled by a TRUE signal (for a task cycle) at the  $bOvfl16$  output for the  $nOut16$  output or at the  $bOvfl32$  output for the  $dnOut32\_p$  output.

[19-68] Signal characteristic

### 19.1.145.2 Example

The current speed at *nSet\_v* and the gearbox factors serve to create a specific machine measuring system from the motor measuring system.

- 216 increments in the motor measuring system are to correspond to 1 motor revolution.
- 216 increments in the machine measuring system (*nOut16*) are to correspond to 1 machine shaft revolution.

#### Initialise integrator

A FALSE/TRUE edge at *bTPReceived* initialises the integrator, i.e. a calculation with *dnTPPosition\_p* and *dnLoadVal\_p* is made:

$$\begin{aligned} nOut16 &= (\text{INT})(dnLoadVal\_p + dnTPPosition\_p \cdot \text{Gearbox factor}) \\ dnOut32\_p &= dnLoadVal\_p + dnTPPosition\_p \cdot \text{Gearbox factor} \end{aligned}$$

- After initialisation is completed, the *blnitDone* output is set to TRUE in the next call cycle.
- In case of a renewed initialisation without a previous reset (*bReset* = TRUE), the *blnitDone* output is set to FALSE for a task cycle.

#### Reset integrator

When *bReset* is set to TRUE, the integrator is set to 0. No calculations are made.

- The Boolean outputs are set to FALSE.
- The *bReset* input has the highest priority.

#### Load integrator

When *bLoad* is set to TRUE, the integrator is loaded with the value at *dnLoadVal\_p* and the outputs are set.

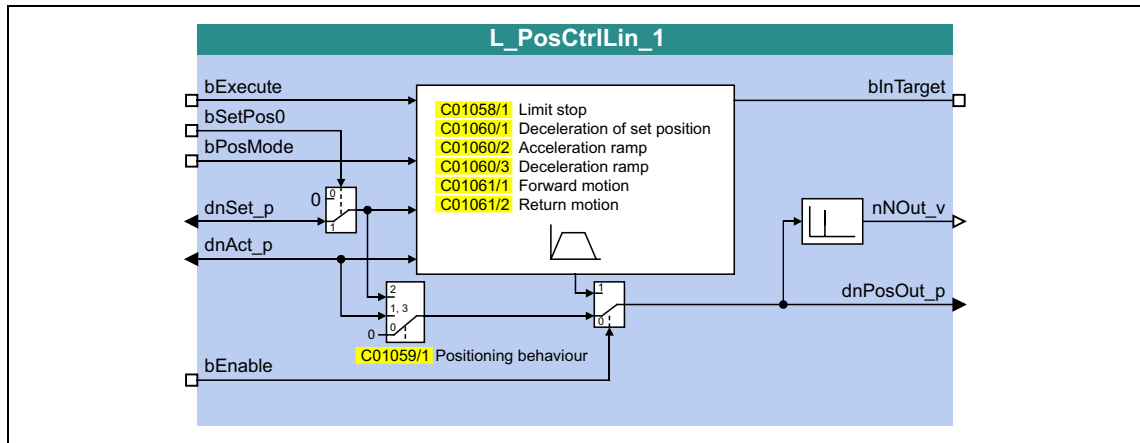

- When *bLoad* is set to TRUE, the input is not integrated and no check for overflow is executed.
- When *bLoad* is reset to FALSE, the integrator continues from the loaded value. The *blnitDone* output is reset to FALSE after a FALSE/TRUE edge at *bTPReceived* with a delay of one call cycle.

## 19.1.146 L\_PosCtrlLin\_1

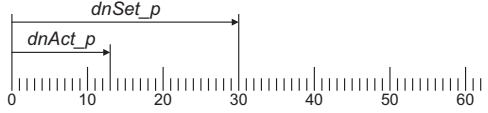

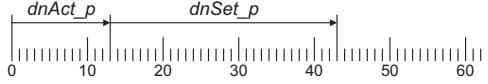

This FB serves to implement the following positioning functions:

- Bring drive to curve position (e.g. after mains connection, manual jog, homing)
- Release drive from curve and bring it to safe position (position override function)
- Positioning the X axis via X offset (higher-level positioning)
- Positioning the Y axis via Y offset (higher-level positioning)

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bExecute   | BOOL      | Execute positioning profile <ul style="list-style-type: none"> <li>• Only possible if the <i>bEnable</i> input is set to TRUE.</li> </ul>   |
|            |           | FALSE No positioning/positioning is aborted. <ul style="list-style-type: none"> <li>• The speed at the <i>nNOOut_v</i> output is braked to standstill via the deceleration ramp set in <a href="#">C01060/1</a> (<i>nNOOut_v</i> = 0).</li> <li>• At the same time, the <i>dnPosOut_p</i> output is stopped.</li> </ul> |
|            |           | FALSE → TRUE Positioning is executed/continued. <ul style="list-style-type: none"> <li>• In case of an activated limit stop (<a href="#">C01058/1</a> = TRUE), a renewed positive edge for a following positioning procedure is required.</li> </ul>  |
| bSetPos0   | BOOL      | Travel to zero position <ul style="list-style-type: none"> <li>• Only possible if the <i>bEnable</i> input is set to TRUE.</li> </ul>   |
|            |           | FALSE The value at the <i>dnSet_p</i> input is used as setpoint position.   |
|            |           | TRUE The value at the <i>dnSet_p</i> input is ignored. The setpoint position is internally set to "0" and the <i>dnPosOut_p</i> output can be travelled to zero position.   |

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bPosMode   | BOOL      | Positioning mode  |

## 19.1.147 L\_PosCtrlLin\_2

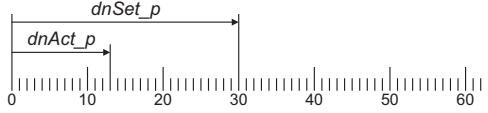

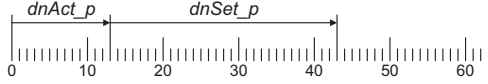

This FB serves to implement the following positioning functions:

- Bring drive to curve position (e.g. after mains connection, manual jog, homing)
- Release drive from curve and bring it to safe position (position override function)
- Positioning the X axis via X offset (higher-level positioning)
- Positioning the Y axis via Y offset (higher-level positioning)

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bExecute   | BOOL      | Execute positioning profile <ul style="list-style-type: none"> <li>• Only possible if the <i>bEnable</i> input is set to TRUE.</li> </ul>   |
|            |           | FALSE No positioning/positioning is aborted. <ul style="list-style-type: none"> <li>• The speed at the <i>nNOOut_v</i> output is braked to standstill via the deceleration ramp set in <a href="#">C01060/4</a> (<i>nNOOut_v</i> = 0).</li> <li>• At the same time, the <i>dnPosOut_p</i> output is stopped.</li> </ul> |
|            |           | FALSE → TRUE Positioning is executed/continued. <ul style="list-style-type: none"> <li>• In case of an activated limit stop (<a href="#">C01058/2</a> = TRUE), a renewed positive edge for a following positioning procedure is required.</li> </ul>  |
| bSetPos0   | BOOL      | Travel to zero position <ul style="list-style-type: none"> <li>• Only possible if the <i>bEnable</i> input is set to TRUE.</li> </ul>   |
|            |           | FALSE The value at the <i>dnSet_p</i> input is used as setpoint position.   |
|            |           | TRUE The value at the <i>dnSet_p</i> input is ignored. The setpoint position is internally set to "0" and the <i>dnPosOut_p</i> output can be travelled to zero position.   |

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bPosMode   | BOOL      | Positioning mode  |

**19.1.148 L\_PosShaftCtrlInterface\_1**

FB in preparation!

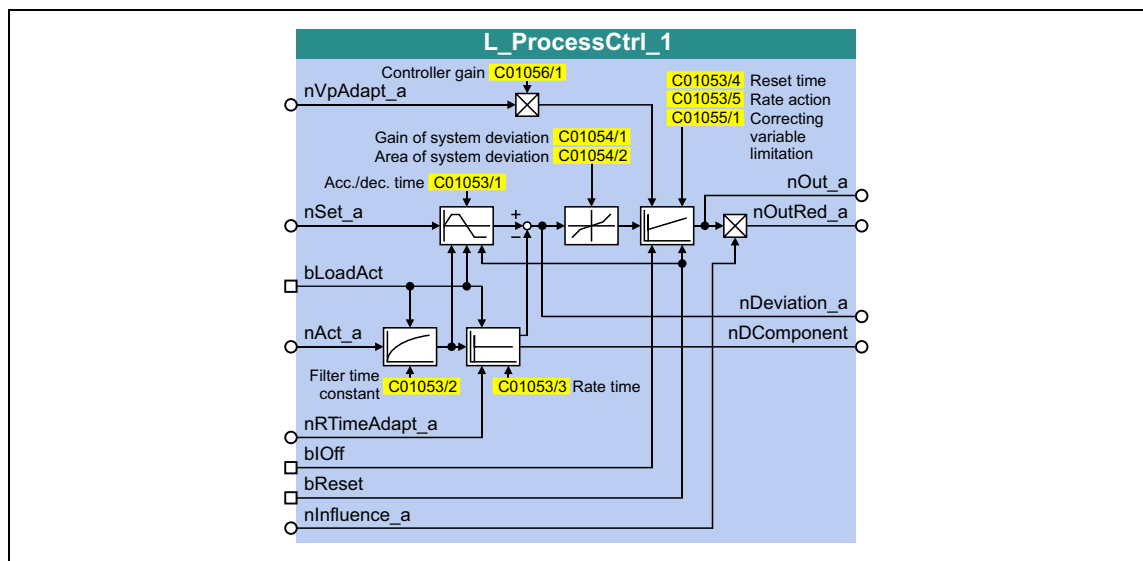

## 19.1.149 L\_ProcessCtrl\_1

This FB serves to implement a dancer position or tension control.

The FB is provided with the following functions:

- Adjustable control algorithm (P, PI, PID) with adaptable gain
- Reduced controller dynamics at low system deviation
- Setpoint ramp generator for preventing setpoint step-changes at the input
- Setpoint ramp generator can be loaded with actual value
- Low-pass filter and rate action in the actual value feedback
- Integral action component can be switched off
- Interruptible control

## inputs

| Designator    | Data type | Information/possible settings  |  |
|---------------|-----------|--|--|
| nVpAdapt_a    | INT       | Proportional evaluation of the controller gain (Vp) <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 %</li><li>• Internal limitation to 0 ... 16384 (0 ... 100 %)</li></ul>  |  |
| nSet_a        | INT       | Controller setpoint  |  |
| bLoadAct      | BOOL      | Accept actual controller value   |  |
|               |           | TRUE   | The actual controller value <i>nAct_a</i> is taken over into the ramp generator, the low pass and the rate action. |
| nAct_a        | INT       | Actual controller value  |  |
| nRTimeAdapt_a | INT       | Proportional evaluation of the rate time in the actual value path <ul style="list-style-type: none"><li>• Scaling: 16384 ≡ 100 % rate time (<a href="#">C01053</a>)</li><li>• Internal limitation to 0 ... 16384 (0 ... 100 %)</li></ul> |  |
| bIOff         | BOOL      | Reset controller I component   |  |
|               |           | TRUE   | The controller I component is reset.   |

| Designator   | Data type | Information/possible settings  |
|--------------|-----------|--|
| bReset       | BOOL      | Reset entire control   |
|              |           | TRUE All outputs are reset to 0.   |
| nInfluence_a | INT       | Proportional evaluation of the controller correcting variable <i>nOutRed_a</i> <ul style="list-style-type: none"> <li>Scaling: 16384 <math>\equiv</math> 100 % controller correcting variable (<i>nOut_a</i>)</li> </ul> |

### outputs

| Designator   | Data type | Value/meaning   |
|--------------|-----------|---|
| nOut_a       | INT       | Controller correcting variable <ul style="list-style-type: none"> <li>Internal limitation to <math>\pm 16384</math> (<math>\pm 100</math> %)</li> </ul> |
| nOutRed_a    | INT       | Controller correcting variable (evaluated by <i>nInfluence_a</i> )  |
| nDeviation_a | INT       | System deviation <ul style="list-style-type: none"> <li>Internal limitation to <math>\pm 32767</math> (<math>\pm 199.99</math> %)</li> </ul>            |
| nDComponent  | INT       | D component of the rate action <ul style="list-style-type: none"> <li>Internal limitation to <math>\pm 16384</math> (<math>\pm 100</math> %)</li> </ul> |

**19.1.149.1 Control characteristic**

The dancer position or tension controller can be optionally operated as P, PI or PID controller. In the Lenze setting, the PI algorithm is active.

**Gain (P component)**

The input value is controlled by a linear characteristic. The slope of the characteristic is determined by the controller gain  $V_p$ .

The controller gain  $V_p$  is set in [C01056/1](#).

- The controller gain can be adapted via the  $nVpAdapt\_a$  input (also possible in online mode).
- The  $nVpAdapt\_a$  input value has a direct effect on the controller gain:

$$P = nVpAdapt\_a \cdot C01056/1$$

**Example:** With the parameterised controller gain  $V_p = 2.0$  and  $nVpAdapt\_a = 75\%$ , the resulting gain factor is as follows:

$$P = \frac{75 [\%]}{100 [\%]} \cdot 2.0 = 1.5$$

**Reset time  $T_n$  (I component)**

The adjustment time  $T_n$  is set under [C01053/4](#).

- The I component of the controller can be deactivated by setting the input  $bIOff$  to TRUE.
- The I component can be switched on and off online.

**Differential component  $K_d$  (D component)**

The differential component  $K_d$  is set under [C01053/5](#).

- The setting "0.0 s" deactivates the D component (Lenze setting). In this way, the PID controller becomes a PI controller or P controller, if the I component has been deactivated as well.

**Evaluation of the output signal (controller influence)**

If the motor speed or motor torque is precontrolled, a low influence is sufficient for the controller to comply with the setpoint.

Use the  $nInfluence\_a$  input to select the influencing factor the controller correcting variable ( $nOut\_a$ ) is to be evaluated with. The evaluated controller correcting variable is output at  $nOutRed\_a$ .

**Note!**

The controller influence evaluates the output signal multiplicatively. A change of the  $nInfluence\_a$  influencing factor also changes the dynamics of the controller!

**Switching on/off the controller**

By setting the  $bReset$  input to TRUE, the process controller can be switched off.

**Loading the setpoint ramp generator with the actual value**

If the actual value is loaded into the setpoint ramp generator in switched-off state, it has the advantage that in the moment of the renewed controller enable, the system deviation is zero first. Thus, compensation processes can be mostly prevented.

When the *bLoadAct* input is set to TRUE, the setpoint ramp generator can be loaded with the actual value. This keeps the system deviation equal to zero and I component of the controller.

**Low pass and rate action in the actual value path**

In order to filter signal interferences more effectively, you can activate a low pass in the actual value path.

- The filter time constant for the low pass is set in [C01053/2](#).
- The rate time constant in the feedback path can be set in [C01053/3](#). This serves to compensate interfering decelerations.

**Reduced controller dynamics at low system deviation**

A reduced controller dynamics at low system deviations serves to have a positive effect on the damping behaviour of the control loop.

- [C01054/2](#) serves to determine the tolerance zone in which the system deviation is transmitted to the controller with a slight gain.
- [C01054/1](#) serves to determine the amount of percent the gain in the defined tolerance zone is to be reduced to.

19.1.150 L\_PT1\_1

This FB filters and delays analog signals.

- The filter time constant  $T$  can be set under [C00249](#).
- The gain is defined with  $V_p = 1$ .

|------------|-----------|---------------|
| nOut       | INT       | Output signal |

Parameters

| Parameters             | Possible settings |    |      | Information   |
|------------------------|-------------------|----|------|---|
| <a href="#">C00249</a> | 0                 | ms | 5000 | Filter time constant <ul style="list-style-type: none"><li>• The filter is not active with a setting of "0 ms". The input signal is passed through one-to-one to the output.</li><li>• Lenze setting: 2000 ms</li></ul> |

Function

[19-69] Filter time constant  $T$  of the first-order delay element

19.1.151 L\_PT1\_2

This FB filters and delays analog signals.

- Filter time constant T can be set in [C00250/1](#).
- The gain is defined with  $V_p = 1$ .

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn_a      | INT       | Input signal                  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut       | INT       | Output signal |

Parameters

| Parameters               | Possible settings |    |      | Information   |

Function

[19-70] Filter time constant T of the first-order delay element

19.1.152 L\_PT1\_3

This FB filters and delays analog signals.

- Filter time constant T can be set in [C00250/2](#).
- The gain is defined with  $V_p = 1$ .

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| nIn_a      | INT       | Input signal                  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut       | INT       | Output signal |

Parameters

| Parameters               | Possible settings |    |      | Information   |
|--------------------------|-------------------|----|------|---|
| <a href="#">C00250/2</a> | 0                 | ms | 5000 | Filter time constant <ul style="list-style-type: none"><li>• The filter is not active with a setting of "0 ms". The input signal is passed through one-to-one to the output.</li><li>• Lenze setting: 2000 ms</li></ul> |

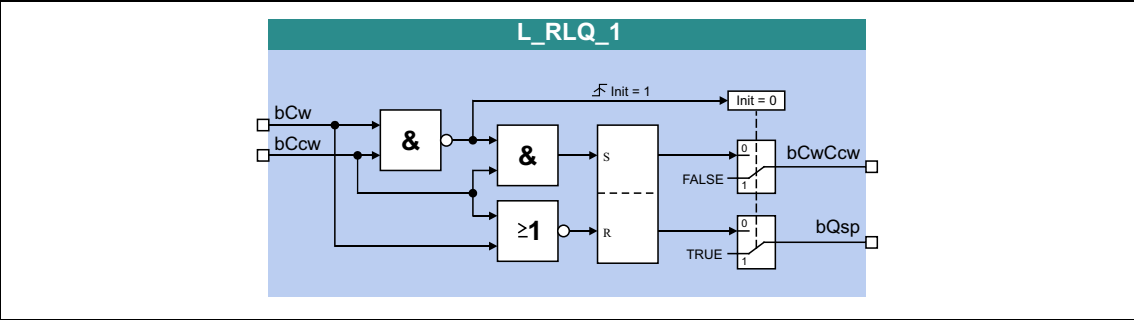

Function

[19-71] Filter time constant T of the first-order delay element

19.1.153 L\_RLQ\_1

This FB links a selected direction of rotation to the quick stop function with wire-break protection.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bCw        | BOOL      | Input <ul style="list-style-type: none"><li>• TRUE = CW rotation</li></ul>  |
| bCCw       | BOOL      | Input <ul style="list-style-type: none"><li>• TRUE = CCW rotation</li></ul> |

outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| bQSP       | BOOL      | Output signal for quick stop (QSP)  |
| bCwCcw     | BOOL      | Output signal for CW/CCW rotation <ul style="list-style-type: none"><li>• TRUE = CCW rotation</li></ul> |

Function

| inputs  |       | outputs  |       | Notes   |
|---|-------|----------|-------|---|
| bCw   | bCCw  | bCwCcw   | bQSP  |   |
| TRUE  | TRUE  | FALSE    | TRUE  | The inputs have this status only if a TRUE signal is being applied to <u>both</u> inputs at the moment of switch-on!<br>See also FB illustration above, "Init" = 1. |
| If <i>one</i> of the inputs has the TRUE status, the following truth table applies: |       |          |       |   |
| FALSE   | FALSE | FALSE    | TRUE  | See also FB illustration above, "Init" = 0.   |
| TRUE  | FALSE | FALSE    | FALSE |   |
| FALSE   | TRUE  | TRUE     | FALSE |   |
| TRUE  | TRUE  | X (save) |       |   |

[19-72] Truth table of the FB L\_RLQ, 0 = FALSE, 1 = TRUE

19.1.154 L\_RSFlipFlop\_1

The functionality of this FB corresponds to that of an RS flipflop:

- An input signal at *bSet* serves to set the *bOut* output permanently.
- An input signal at *bReset* serves to reset the output.
- Additional, inverted output *bNegOut*

inputs

| Designator | Data type | Information/possible settings |   |
|------------|-----------|-------------------------------|---|
| bSet       | BOOL      | Setting input                 |   |
|            |           | TRUE                          | <ul style="list-style-type: none"><li>• The <i>bOut</i> output is set to TRUE.</li><li>• The <i>bNegOut</i> output is set to FALSE.</li></ul> |
| bReset     | BOOL      | Reset input                   |   |
|            |           | TRUE                          | <ul style="list-style-type: none"><li>• The <i>bOut</i> output is set to FALSE.</li><li>• The <i>bNegOut</i> output is set to TRUE.</li></ul> |

outputs

| Designator | Data type | Value/meaning           |
|------------|-----------|-------------------------|
| bOut       | BOOL      | Output signal           |
| bNegOut    | BOOL      | Output signal, inverted |

19.1.155 L\_RSFlipFlop\_2

The functionality of this FB corresponds to that of an RS flipflop:

- An input signal at *bSet* serves to set the *bOut* output permanently.
- An input signal at *bReset* serves to reset the output.
- Additional, inverted output *bNegOut*

inputs

| Designator | Data type | Information/possible settings |   |
|------------|-----------|-------------------------------|---|
| bSet       | BOOL      | Setting input                 |   |
|            |           | TRUE                          | <ul style="list-style-type: none"><li>• The <i>bOut</i> output is set to TRUE.</li><li>• The <i>bNegOut</i> output is set to FALSE.</li></ul> |
| bReset     | BOOL      | Reset input                   |   |
|            |           | TRUE                          | <ul style="list-style-type: none"><li>• The <i>bOut</i> output is set to FALSE.</li><li>• The <i>bNegOut</i> output is set to TRUE.</li></ul> |

outputs

| Designator | Data type | Value/meaning           |
|------------|-----------|-------------------------|
| bOut       | BOOL      | Output signal           |
| bNegOut    | BOOL      | Output signal, inverted |

### 19.1.156 L\_SampleHold\_1

This FB can save a signal.

- The saved value is also available after mains switching.

#### inputs

| Designator | Data type | Information/possible settings  |
|------------|-----------|--|
| nIn_a      | INT       | Input signal   |
| bLoad      | BOOL      | Save input signal  |
|            |           | FALSE The last-valid value at <i>nIn</i> is saved and output to <i>nOut</i> . A signal change at <i>nIn</i> does not cause a change at <i>nOut</i> . |
|            |           | TRUE The <i>nOut</i> output provides <i>dnIn</i> .   |

#### outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut       | INT       | Output signal |

#### Function

- When *bLoad* = TRUE, the *nIn\_a* signal is switched to *nOut\_a*.
- When *bLoad* = FALSE, the last-valid value is saved and output at *nOut\_a*. A signal change at *nIn\_a* does not cause a change at *nOut\_a*.

#### Behaviour after mains switching

The last-loaded value is permanently stored after switching of the supply voltage and reloaded after restart.

- In order that the saved value is not immediately overwritten with the current input signal at *nIn* after restart, *bLoad* must be set to FALSE at restart.

### 19.1.157 L\_SampleHold\_2

This FB can save a signal.

- The saved value is also available after mains switching.

#### inputs

| Designator | Data type | Information/possible settings  |
|------------|-----------|--|
| nIn_a      | INT       | Input signal   |
| bLoad      | BOOL      | Save input signal  |
|            |           | FALSE The last-valid value at <i>nIn</i> is saved and output to <i>nOut</i> . A signal change at <i>nIn</i> does not cause a change at <i>nOut</i> . |
|            |           | TRUE The <i>nOut</i> output provides <i>dnIn</i> .   |

#### outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| nOut       | INT       | Output signal |

#### Function

- When *bLoad* = TRUE, the *nIn\_a* signal is switched to *nOut\_a*.
- When *bLoad* = FALSE, the last-valid value is saved and output at *nOut\_a*. A signal change at *nIn\_a* does not cause a change at *nOut\_a*.

#### Behaviour after mains switching

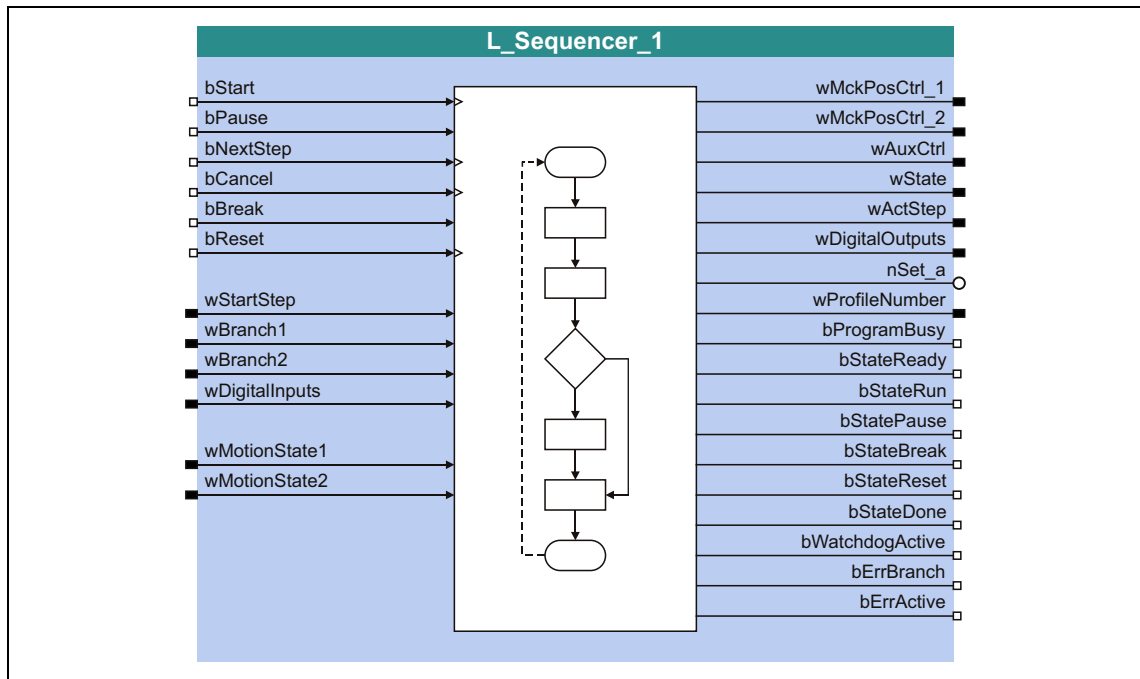

The last-loaded value is permanently stored after switching of the supply voltage and reloaded after restart.

- In order that the saved value is not immediately overwritten with the current input signal at *nIn* after restart, *bLoad* must be set to FALSE at restart.

## 19.1.158 L\_Sequencer\_1

This FB processes a positioning program by means of a sequence table.

- The sequence table is a central component of this FB and is represented by a code with 100 subcodes where each subcode references to a program segment which is called "action".
- Different action types are available which serve to realise, for instance, program branching, switching operation, waiting times and counters. The actions themselves are represented by codes as well.
  - The following action types are passive: "Branching", "variable branching", "switching", "setting the counter", "counting", "time waiting" and "program end". When these action types are being processed, the "Stop" operating mode is active and a brake, if available, will be applied.
  - The action types "positioning" and "homing", however, are active as these two action types trigger the execution of the respective basic function via the corresponding control inputs.
  - The "Stand-by" action type is active when a setpoint has been set for the speed follower or a setpoint position is transferred to the SB [LS\\_MotionControlKernel](#) when "position follower" has been selected.

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bStart     | BOOL      | Start/continue positioning program  |
|            |           | FALSE → TRUE<br>The positioning program is started/continued. <ul style="list-style-type: none"> <li>• Counters and outputs are not reset automatically through this.</li> <li>• A positioning program previously interrupted by <i>bBreak</i> is continued with the sequence step.</li> <li>• The started positioning program is processed up to its program end even if <i>bStart</i> is reset to FALSE again.</li> </ul> |

| Designator | Data type | Information/possible settings  |   |
|------------|-----------|--|---|
| bPause     | BOOL      | Interrupt the current step of the positioning program  |   |
|            |           | TRUE   | <ul style="list-style-type: none"><li>• An active positioning is interrupted.<ul style="list-style-type: none"><li>• The drive is stopped with the current profile deceleration.</li><li>• A deceleration override is considered.</li></ul></li><li>• The sequence of an active timing element is stopped.</li><li>• An action of "<a href="#">Standby</a>" type is not interrupted.</li></ul>  |
|            |           | FALSE  | <ul style="list-style-type: none"><li>• The interrupted positioning is completed.<ul style="list-style-type: none"><li>• The distance of the profile already covered is considered here.</li><li>• Positionings with final speed are not continued when the final speed cannot be reached anymore.</li></ul></li><li>• The sequence of the stopped timing element is continued with the remaining time.</li></ul>   |
| bNextStep  | BOOL      | Cancel the current step and go to the next step  |   |
|            |           | FALSE→TRUE   | The current step of the positioning program is cancelled immediately and the positioning program is continued with the next step in the sequence table.   |
| bCancel    | BOOL      | Cancel the current step and go to the step defined in <a href="#">C01404</a>   |   |
|            |           | FALSE→TRUE   | The current step of the positioning program is cancelled immediately and the positioning program is continued with the step defined in <a href="#">C01404</a> .   |
| bBreak     | BOOL      | Interrupt positioning program <ul style="list-style-type: none"><li>• This input is intended for being connected to drive-relevant status signals (e.g. for controller inhibit or quick stop).</li><li>• If the interruption is deactivated again by a reset to FALSE, a new FALSE/TRUE edge is required at <i>bStart</i> in order that the positioning program is continued with the sequence step.</li></ul> |   |
|            |           | FALSE  | Condition for program start via <i>bStart</i> .   |
|            |           | TRUE   | <p>The active positioning program is interrupted.</p> <ul style="list-style-type: none"><li>• If a positioning is active, the drive is brought to a standstill with the delay time for stop (<a href="#">C01251/1</a>).</li><li>• The MCK operating modes <a href="#">Speed follower</a>, <a href="#">Homing</a>, <a href="#">Positioning</a> and <a href="#">Position follower</a> are deactivated.</li><li>• The digital output signals keep their states.</li></ul>                        |
| bReset     | BOOL      | Reset positioning program. <ul style="list-style-type: none"><li>• Also possible with interrupted positioning program.</li></ul>   |   |
|            |           | FALSE→TRUE   | <p>The positioning program is reset.</p> <ul style="list-style-type: none"><li>• If a positioning is active, the drive is brought to a standstill with the delay time for stop (<a href="#">C01251/1</a>) without considering an acceleration override.</li><li>• The program flow is cancelled ("program end").</li><li>• The digital output signals, counters and timing elements are reset.</li><li>• A possibly active action of the "<a href="#">Standby</a>" type is aborted.</li></ul> |
| wStartStep | WORD      | Step of the sequence table the positioning program is to start with.   |   |
|            |           | 0  | Positioning program starts with step 1 of the sequence table.   |
|            |           | 1 ... 100  | First step  |
|            |           | Others   | Positioning program does not start.   |
|            |           | Not assigned   | Positioning program starts with step 1 of the sequence table.   |

| Designator                     | Data type   | Information/possible settings  |       |                             |       |   |     |   |        |                    |    |   |     |                             |

|                                | Bit 3             | Cancel   |     |   |
|                                | Bit 4             | Reset  |     |   |
|                                | Bit 5             | NextStep   |     |   |
| <a href="#">C01404</a>         |                   |  |     | Step takes place when <i>bCancel</i> = TRUE <ul style="list-style-type: none"><li>This step is processed if the <i>bCancel</i> input is set to TRUE.</li></ul>  |
|                                | 0                 | Sequence step  |     |   |
|                                | 1...100           | Step 1 ... 100   |     |   |
|                                | 101               | Program end  |     |   |

### 19.1.158.1 Connection to the basic drive functions (MCK)

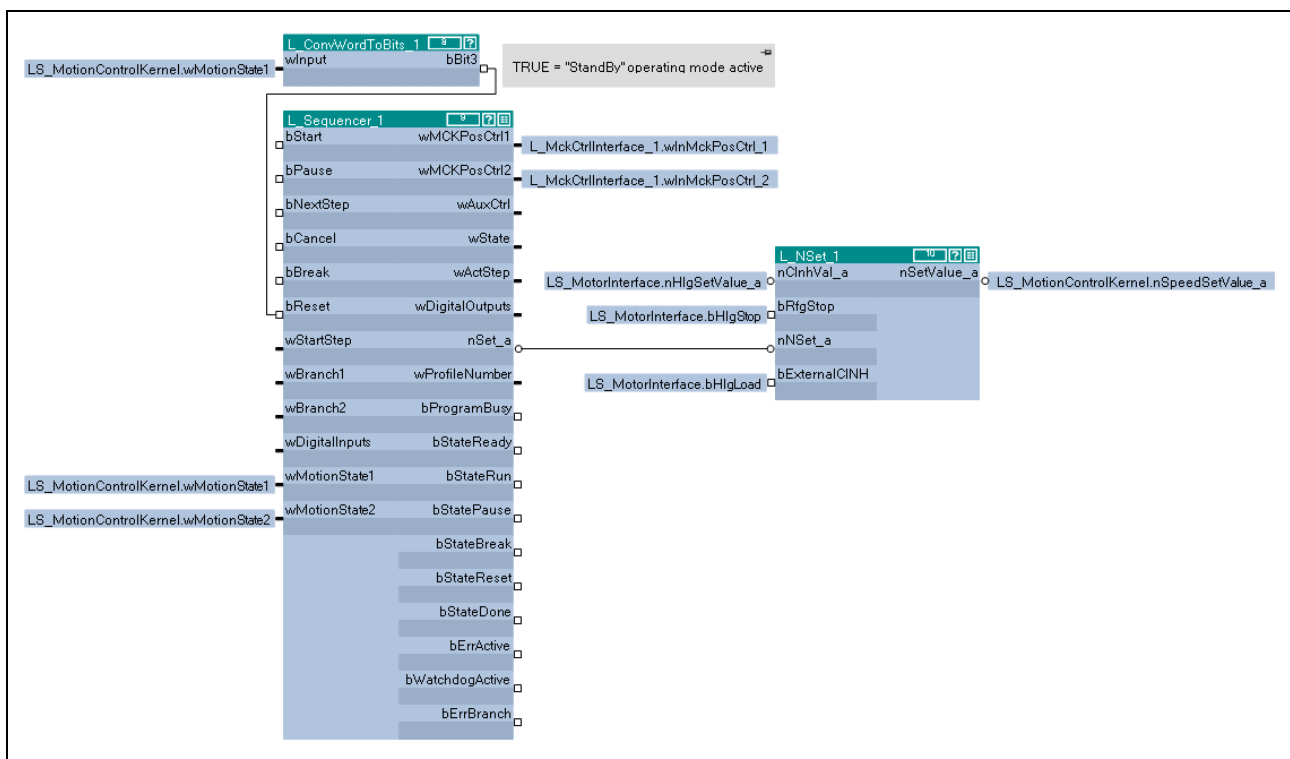

#### Required connections in the FB Editor

The recommended starting basis for a connection with the FB **L\_Sequencer\_1** is the use of the [TA "Table positioning"](#).

The following configuration shows the required connections in order that the execution of the prevailing basic function is triggered in **LS\_MotionControlKernel** for the two action types "Positioning" and "Referencing".

With a corresponding parameter setting, the *nSet\_a* output serves to transfer a speed setpoint to the basic function "speed follower" if an action of Standby" type is active.

The process is reset in the MCK "Standby" operating mode. The internal "StandBy" operating mode is assumed implicitly if controller inhibit, pulse inhibit, quick stop and/or DC-injection braking are activated. ▶ ["StandBy" operating mode](#) (596)

[19-73] Basic integration of the sequence control into the application

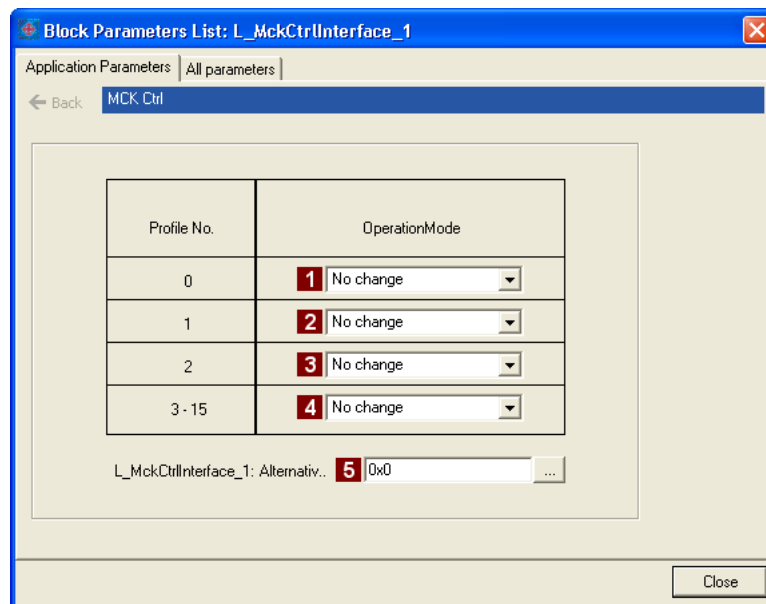

#### Note!

The FB **L\_Sequencer\_1** has to be called in the processing order before the FB **L\_MckCtrlInterface\_1**!

### Required parameter settings

For an error-free function of the sequence control, the following parameter settings are required for the FB [L\\_MckCtrlInterface\\_1](#):

| Parameters |   | Information  |
|------------|---|--|
| <b>1</b>   | <b>MCK operating mode at profile no. 0</b><br>( <a href="#">C01298/1</a> )      | Selection of the operating mode for profile 0 ... 15 at L_MckCtrlInterface_1.<br><b>For these four parameters, set the selection "0: No change" (no assignment of an operating mode to a profile).</b>                       |
| <b>2</b>   | <b>MCK operating mode at profile no. 1</b><br>( <a href="#">C01298/2</a> )      |  |
| <b>3</b>   | <b>MCK operating mode at profile no. 2</b><br>( <a href="#">C01298/3</a> )      |  |
| <b>4</b>   | <b>MCK operating mode at profile no. 3...15</b><br>( <a href="#">C01298/4</a> ) |  |
| <b>5</b>   | <b>L_MckCtrlInterface_1: Alternative function</b><br>( <a href="#">C01297</a> ) | Bit coded selection of the <a href="#">Alternative functions</a> for the bit 16 (PosExecute) in the MCK control word.<br><b>For this parameter, set the hexadecimal value "0x0" to deactivate all alternative functions.</b> |

#### 19.1.158.2 Priorities of the control signals

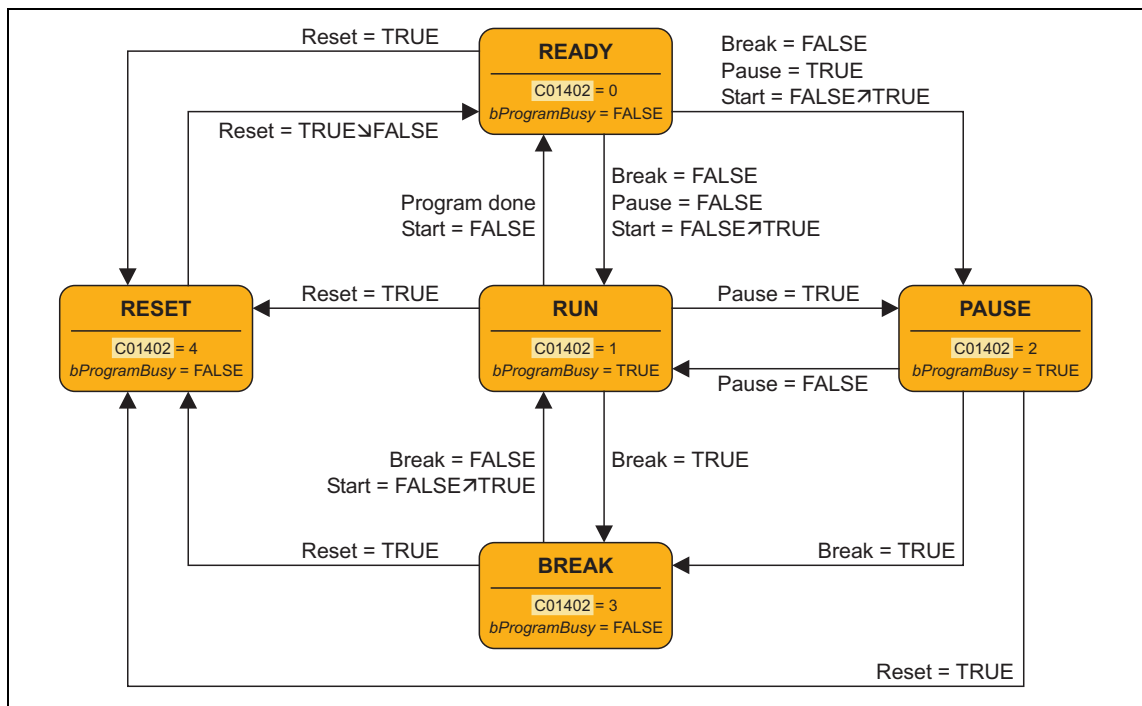

The boolean control signals have the following priorities (1 = highest priority):

1. *bReset*
2. *bBreak*
3. *bPause*
4. *bStart*
5. *bCancel*

### 19.1.158.3 States of the sequencer

The internal state machine of the sequencer distinguishes the following five states:

| State | Display<br><a href="#">C01402</a> | Impact/meaning   |
|-------|-----------------------------------|--|
| READY | 0                                 | When there is no interruption by <i>bBreak</i> , the program can be started.   |
| RUN   | 1                                 | The program is processed.  |
| Break | 2                                 | The program is paused and the traversing of a profile is stopped. <ul style="list-style-type: none"> <li>The outputs keep their states</li> <li>An active positioning is interrupted. <ul style="list-style-type: none"> <li>The drive is stopped with the current profile deceleration.</li> <li>A acceleration override is not considered.</li> </ul> </li> <li>After deactivating the break, the positioning program and a previously active positioning are continued at the same position.</li> </ul> |
| Break | 3                                 | The traversing of a profile is cancelled. <ul style="list-style-type: none"> <li>The drive with the delay time for stop (<a href="#">C01251/1</a>) is brought to a standstill.</li> <li>The digital output signals keep their states.</li> <li>After the interruption has been deactivated (<i>bBreak</i> = FALSE), another start signal is required to continue the program with the sequence step.</li> </ul>  |
| RESET | 4                                 | The program is reset. <ul style="list-style-type: none"> <li>An active positioning is cancelled. <ul style="list-style-type: none"> <li>The drive with the delay time for stop (<a href="#">C01251/1</a>) is brought to a standstill.</li> <li>A acceleration override is not considered.</li> </ul> </li> <li>The program flow is cancelled ("program end").</li> <li>The digital output signals and the counter are reset.</li> <li>If a standby operation is active, it will be cancelled.</li> </ul>   |

[19-74] Internal state machine of the sequencer

### 19.1.158.4 Overview: Available action types

The program flow of the sequential positioning control is defined by means of a sequence table which can contain up to 100 references to "actions".

- An action comprises a clear functionality which is described with a few parameters.
- Different action types are available which serve to realise, for instance, program branching, switching operation, waiting times and counters.
- A certain number of actions are available from every action type which can be parameterised individually.
- An action can be called from several positions in the sequence table.
- After an action has been processed, the action entered in the sequence step of the sequence table is automatically processed unless a branching causes a jump to another step in the sequence table.
- Maximally one action can be processed per calculation cycle.
- The sequence table and the actions themselves are represented by parameters (codes with subcodes).
- Action calls are entered in the sequence table as a decimal number that contains the action type **A** and the action number **B**:

#### Overview

| Action                          | Action type<br><b>A</b> | Action number<br><b>B</b> | Number of available actions | Parameter range   |
|---------------------------------|-------------------------|---------------------------|-----------------------------|-------------------|
| <a href="#">Program end</a>     | 0                       | 000                       | 1                           | -                 |
| <a href="#">Positioning</a>     | 1                       | 001 ... 050               | 50                          | C01405 ... C01410 |
| <a href="#">Switch</a>          | 2                       | 001 ... 016               | 16                          | C01411 ... C01414 |
| <a href="#">Branch</a>          | 3                       | 001 ... 016               | 16                          | C01415 ... C01417 |
| <a href="#">Variable branch</a> | 4                       | 001 ... 002               | 2                           | C01418 ... C01437 |
| <a href="#">Homing</a>          | 5                       | 000                       | 1                           | -                 |
| <a href="#">Wait</a>            | 7                       | 001 ... 008               | 8                           | C01438 ... C01440 |
| <a href="#">Set counter</a>     | 8                       | 001 ... 005               | 5                           | C01441 ... C01442 |
| <a href="#">Count</a>           | 9                       | 001 ... 008               | 8                           | C01443 ... C01448 |
| <a href="#">Standby</a>         | 10                      | 001 ... 005               | 5                           | C01449 ... C01452 |

You can find detailed some information with regard to the action types in the following subchapters.

**19.1.158.5 Action type "Program end"**

In order to define the program end within the sequence table, an action of "program end" type is available.

**Action call (entry in the sequence table)****0**

(Leading zeros can be omitted.)

- When the *bStart* input is reset to FALSE while the positioning program is running, processing is only continued until program end is reached.
- In the Lenze setting, all entries of the sequence table are set to "0" and thus to "program end".

## 19.1.158.6 Action type "positioning"

For starting a positioning, 50 actions of "positioning" type are available. The [Profile entry](#) is made via the parameters of the basic function "[Positioning](#)".

## Action call (entry in the sequence table)

**1** **x** **x** **x** with action number xxx = 001 ... 050

## Parameters

The available actions 1 ... 50 are represented via the subcodes 1 ... 50.

| Parameters                    | Possible settings   |  |             | Information   |
|-------------------------------|---|--|-------------|---|
| <a href="#">C01405/1...50</a> |   |  |             | Pos. action n: Starting with  |
|                               | 0   | Waiting function deactivated                             |             | In the default setting, execution of the profile is started immediately.  |
|                               | 1   | Sequencer input 1<br>(Bit 0 of <i>wDigitalInputs</i> )   |             | "Wait for level": The execution of the profile is only started when the selected sequencer input has the polarity set in <a href="#">C01406/x</a> .                                     |
|                               | 2   | Sequencer input 2<br>(Bit 1 of <i>wDigitalInputs</i> )   |             |   |
|                               | ...   | ...  |             |   |
|                               | 16  | Sequencer input 16<br>(Bit 15 of <i>wDigitalInputs</i> ) |             |   |
| <a href="#">C01406/1...50</a> |   |  |             | Pos. action n: Polarity input   |
|                               | 0   | Condition is bit state "0"                               |             | • State which the sequencer input selected for the profile start must have.   |
|                               | 1   | Condition is bit state "1"                               |             |   |
| <a href="#">C01407/1...50</a> |   |  |             | Pos. action n: Profile number   |
|                               | 0   | No profile executed                                      |             | • A sequence profile can be set in the corresponding profile parameter.   |
|                               | 1...15  | Execute profile no. 1 ... 15                             |             |   |
| <a href="#">C01408/1...50</a> |   |  |             | Pos. action n: Jump destination   |
|                               | 0   | Sequence step  |             | • Step within the sequence table which is processed after the profile has been executed.  |
|                               | 1...100   | Step 1 ... 100   |             |   |
| <a href="#">C01409/1...50</a> | 0.000   | s  | 2147480.000 | Pos. action n: Monitoring time<br>• If the positioning process lasts longer than the monitoring time set here, it is branched to the jump destination set in <a href="#">C01410/x</a> . |
|                               | When "0.000 s" is set (Lenze setting), the time monitoring function is deactivated. |  |             |   |
| <a href="#">C01410/1...50</a> |   |  |             | Pos. action n: Jump destination monitoring  |
|                               | 0   | Sequence step  |             | • Step which is executed after the monitoring time has been exceeded.   |
|                               | 1...100   | Step 1 ... 100   |             |   |

## 19.1.158.7 Action type "switching"

For switching digital output signals, 16 actions of the "Switch" type are provided. Each action can set two bits of the *wDigitalOutputs* output signal, which can be selected, to "0" or "1", alternatively and independently of each other.

## Action call (entry in the sequence table)

**2** **x** **x** **x** with action number xxx = 001 ... 016

## Parameters

The available actions 1 ... 16 are represented via the subcodes 1 ... 16.

| Parameters                    | Possible settings   | Information  |
|-------------------------------|---|--|
| <a href="#">C01411/1...16</a> | <b>0 Deactivated</b>  | Switching act. n: Output switching A<br>• Selection of the sequencer output which is to be set to the polarity set in <a href="#">C01412/x</a> . |
|                               | 1 Sequencer output 1<br>(Bit 0 of <i>wDigitalOutputs</i> )    |  |
|                               | 2 Sequencer output 2<br>(Bit 1 of <i>wDigitalOutputs</i> )    |  |
|                               | ... ...   |  |
|                               | 16 Sequencer output 16<br>(Bit 15 of <i>wDigitalOutputs</i> ) |  |
| <a href="#">C01412/1...16</a> | <b>0 Set output bit to "0"</b>                                | Switching act. n: Pol. switching A<br>• State to which the sequencer output selected in <a href="#">C01411/x</a> is to be set.                   |
|                               | 1 Set output bit to "1"                                       |  |
| <a href="#">C01413/1...16</a> | <b>0 Deactivated</b>  | Switching act. n: Output switching B<br>• Selection of the sequencer output which is to be set to the polarity set in <a href="#">C01414/x</a> . |
|                               | 1 Sequencer output 1<br>(Bit 0 of <i>wDigitalOutputs</i> )    |  |
|                               | 2 Sequencer output 2<br>(Bit 1 of <i>wDigitalOutputs</i> )    |  |
|                               | ... ...   |  |
|                               | 16 Sequencer output 16<br>(Bit 15 of <i>wDigitalOutputs</i> ) |  |
| <a href="#">C01414/1...16</a> | <b>0 Set output bit to "0"</b>                                | Switching act. n: Pol. switching B<br>• State to which the sequencer output selected in <a href="#">C01413/x</a> is to be set.                   |
|                               | 1 Set output bit to "1"                                       |  |

### 19.1.158.8 Action type "Branching"

For conditional and unconditional branching (jumps), 16 actions of "Branching" Type are available.

#### Action call (entry in the sequence table)

with action number xxx = 001 ... 016

#### Parameters

The available actions 1 ... 16 are represented via the subcodes 1 ... 16.

| Parameters                    | Possible settings   | Information  |
|-------------------------------|---|--|
| <a href="#">C01415/1...16</a> |   | Branching action n: Input for jump   |
|                               | 0 Unconditional branch                                      | "Unconditional branch": It is always branched to the jump destination set in <a href="#">C01417/x</a> .  |
|                               | 1 Sequencer input 1<br>(Bit 0 of <i>wDigitalInputs</i> )    | "Conditional branch": It is only branched to the jump destination set in <a href="#">C01417/x</a> if the selected sequencer input has the polarity set in <a href="#">C01416/x</a> .<br>• Otherwise, the following step in the sequence table will be processed.   |
|                               | 2 Sequencer input 2<br>(Bit 1 of <i>wDigitalInputs</i> )    |  |
|                               | ... ..  |  |
|                               | 16 Sequencer input 16<br>(Bit 15 of <i>wDigitalInputs</i> ) |  |
| <a href="#">C01416/1...16</a> |   | Branching action n: Polarity input   |
|                               | 0 Condition is bit state "0"                                | • State of the selected sequencer input required for a conditional branch to the jump destination.   |
|                               | 1 Condition is bit state "1"                                |  |
| <a href="#">C01417/1...16</a> |   | Branching act. n: Jump destination   |
|                               | 0 Sequence step   | <ul style="list-style-type: none"> <li>• In case of unconditional branch, it is always branched to the jump destination set here.</li> <li>• In case of conditional branch, it is only branched to the jump destination set here if the sequencer input selected in <a href="#">C01415/x</a> has the polarity set in <a href="#">C01416/x</a>. Otherwise, the following step in the sequence table will be processed.</li> </ul> |
|                               | 1...100 Step 1 ... 100                                      |  |

### 19.1.158.9 Action type "Variable branching"

For variable branching (jumps), two actions of "variable branching" type are available.

- Branching to one of 20 possible steps is carried out depending on the *wBranch1* input signal or *wBranch2* input signal at the time of processing.
  - *wBranch1* input signal defines branching for action 1.
  - *wBranch2* input signal defines branching for action 2.
- Example: If the *wBranch2* input signal has the value "15" at the time of processing of the action no. 2, it is branched to the step entered in the parameter "Var. branching n: Jump destination 15" for action no. 2 ([C01432/2](#)).

#### Action call (entry in the sequence table)

with action number xxx = 001 ... 002

#### Parameters

The available actions 1 ... 2 are represented via the subcodes 1 ... 2.

| Parameters                   | Possible settings |  | Information   |
|------------------------------|-------------------|--|---|
| <a href="#">C01418/1...2</a> |                   |  | Var. branch n: Jump destination 1 ... 20<br>• Branch destinations 1 ... 20 for input values 1 ... 20 of <i>wBranch1...2</i> . |
| ...                          | 0                 | <b>Branching deactivated</b><br>(The following step in the sequence table is processed.) |   |
| <a href="#">C01437/1...2</a> | 1...100           | Step 1 ... 100   |   |

**19.1.158.10 Action type "Homing"**

For starting a homing, an action of "homing" type is available.

- The settings for homing (e.g. homing mode) can be made via the parameters of the basic function "[Homing](#)".
- After homing is completed (*bHomingDone* = TRUE), the program flow is continued with the next step.

**Action call (entry in the sequence table)**

|   |   |   |   |
|---|---|---|---|
| 5 | 0 | 0 | 0 |
|---|---|---|---|

**Parameters**

The "homing" action has no own parameters.

## 19.1.158.11 Action type "Time waiting"

For inserting waiting times into the program flow, 8 actions of "Time waiting" are available. The sequence step will only be processed after a waiting time has elapsed or when a selectable sequencer input has a certain bit state ("0" or "1").

## Action call (entry in the sequence table)

**7** **x** **x** **x** with action number xxx = 001 ... 008

## Parameters

The available actions 1 ... 8 are represented via the subcodes 1 ... 8.

| Parameters                   | Possible settings |  |             | Information  |
|------------------------------|-------------------|--|-------------|--|
| <a href="#">C01438/1...8</a> | 0.000             | s  | 2127480.000 | Waiting act. n: Waiting time<br>• Initialisation: 1.000 s  |
| <a href="#">C01439/1...8</a> |                   |  |             | Waiting act. n: Input for "Next"   |
|                              | 0                 | Input deactivated  |             | "Wait": Sequence step is only processed after the waiting time set has elapsed.  |
|                              | 1                 | Sequencer input 1<br>(Bit 0 of <i>wDigitalInputs</i> )   |             | "Wait for level": Sequence step will only be processed when the selected sequencer input has the polarity set in <a href="#">C01440/x</a> .<br><b>Note!</b><br>However, if a waiting time > 0 s is set, the sequence step is processed at the latest after the waiting time set has elapsed. |
|                              | 2                 | Sequencer input 2<br>(Bit 1 of <i>wDigitalInputs</i> )   |             |  |
|                              | ...               | ...  |             |  |
|                              | 16                | Sequencer input 16<br>(Bit 15 of <i>wDigitalInputs</i> ) |             |  |
| <a href="#">C01440/1...8</a> |                   |  |             | Waiting act. n: Polarity input   |
|                              | 0                 | Condition is bit state "0"                               |             | • State which the sequencer input selected must have so that the sequence step is processed.   |
|                              | 1                 | Condition is bit state "1"                               |             |  |

### 19.1.158.12 Action type "Counter setting"

For setting one of the 5 available counters to a certain starting value, 5 actions of "Counter setting" type are available.

- The 5 actions of the "Counter setting" type are not permanently assigned to the 5 counters.
- You can, e.g., set a counter to a value using an action of "counter setting" type and at a later program time set the same counter to a different value using another action of "counter setting" type.
- The current counter content of the counters 1 ... 5 is displayed in [C01443/1...5](#).

**Action call (entry in the sequence table)**

with action number xxx = 001 ... 005

#### Parameters

The available actions 1 ... 5 are represented via the subcodes 1 ... 5.

| Parameters                   | Possible settings |                             |            | Information                            |
|------------------------------|-------------------|-----------------------------|------------|--|
| <a href="#">C01441/1...5</a> |                   |                             |            | Counter setting act. n: Counter no.    |
|                              | 0                 | Counter setting deactivated |            |  |
|                              | 1                 | Counter 1                   |            |  |
|                              | ...               | ...                         |            |  |
|                              | 5                 | Counter 5                   |            |  |
| <a href="#">C01442/1...5</a> | -2147483647       |                             | 2147483647 | Counter setting act. n: Starting value |

## 19.1.158.13 Action type "Counting"

For counting processes, 8 actions of "counting" type are available.

- Every processing of the action causes an increase or decrease of the counter content of the corresponding counter by the set step value (counting up or down).
- If the comparison condition for comparing the counter content to an adjustable comparison value is fulfilled, it can be branched to any step.
- For setting a counter to a starting value, 5 actions of "[counter setting](#)" type are available.
- The current counter content of the counters 1 ... 5 is displayed in [C01443/1...5](#).

## Action call (entry in the sequence table)

**9** **x** **x** **x** with action number xxx = 001 ... 008

## Parameters

The available actions 1 ... 8 are represented via the subcodes 1 ... 8.

| Parameters                   | Possible settings |   |            | Information  |
|------------------------------|-------------------|---|------------|--|
| <a href="#">C01443/1...5</a> | -2147483647       |   | 2147483647 | Counter n: Current counter content<br>• Read only  |
| <a href="#">C01444/1...8</a> |                   |   |            | Counting act. n: Counter no.   |
|                              | 0                 | Counting deactivated<br>(Sequence step is processed.) |            |  |
|                              | 1                 | Counter 1   |            |  |
|                              | ...               | ...   |            |  |
|                              | 5                 | Counter 5   |            |  |
| <a href="#">C01445/1...8</a> | -2147483647       |   | 2147483647 | Counting act. n: Step value<br>• Value by which the counter is increased or decreased.<br>• Initialisation: 1  |
| <a href="#">C01446/1...8</a> | -2147483647       |   | 2147483647 | Counting act. n: Comparison value<br>• Value to which the counter is compared.   |
| <a href="#">C01447/1...8</a> |                   |   |            | Counting act. n: Jump destination<br>• If the set comparison condition is fulfilled, it is branched to the step set here.<br>• If the condition is not fulfilled or "0" setting, the step followed in the sequence table is processed. |
|                              | 0                 | Sequence step   |            |  |
|                              | 1...100           | Step 1 ... 100  |            |  |
| <a href="#">C01448/1...8</a> |                   |   |            | Counting act. n: Comparison operation  |
|                              | 1                 | Counter content = comparison value                    |            |  |
|                              | 2                 | Counter content > comparison value                    |            |  |
|                              | 3                 | Counter content ≥ comparison value                    |            |  |
|                              | 4                 | Counter content < comparison value                    |            |  |
|                              | 5                 | Counter content ≤ comparison value                    |            |  |

### 19.1.158.14 "Stand-by" action type

Standby

For a temporary activation of a setpoint follower, 5 actions of "stand-by" type are available.

- The corresponding setpoint follower remains enabled until the condition for completing stand-by is fulfilled.
- If the "stand-by" step is active, the setpoint set in [C01452](#) is provided at the *nSet\_a* output (Lenze setting: 0 %).

#### Action call (entry in the sequence table)

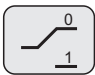

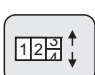

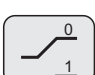

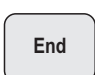

**1** **0** **x** **x** **x** with action number xxx = 001 ... 005

#### Parameters

The available actions 1 ... 5 are represented via the subcodes 1 ... 5.

| Parameters                   | Possible settings |  |     | Information   |
|------------------------------|-------------------|--|-----|---|
| <a href="#">C01449/1...5</a> |                   |  |     | Stand-by act. n: Input for "End" <ul style="list-style-type: none"><li>The setpoint follower selected in <a href="#">C01451/x</a> remains enabled until the sequencer input selected here has the polarity set in <a href="#">C01450/x</a>.</li></ul> |
|                              | 1                 | Sequencer input 1<br>(Bit 0 of <i>wDigitalInputs</i> )   |     |   |
|                              | 2                 | Sequencer input 2<br>(Bit 1 of <i>wDigitalInputs</i> )   |     |   |

| <a href="#">C01400/...</a> | ...   | ...   | ... | ...   |
| <a href="#">C01400/100</a> | 0     |  | -   | Program end                                 |

### 19.1.159 L\_SignalMonitor\_a

This FB outputs four analog signals which can be selected from a list of analog output signals of all function blocks provided in the device.

- Offset and gain of the source signals are adjustable.

#### outputs

| Designator | Data type | Value/meaning   |
|------------|-----------|---|
| nOut1_a    | INT       | Output signal<br>• Internal limitation to $\pm 32767$ |
| nOut2_a    | INT       | Output signal<br>• Internal limitation to $\pm 32767$ |
| nOut3_a    | INT       | Output signal<br>• Internal limitation to $\pm 32767$ |
| nOut4_a    | INT       | Output signal<br>• Internal limitation to $\pm 32767$ |

#### Parameters

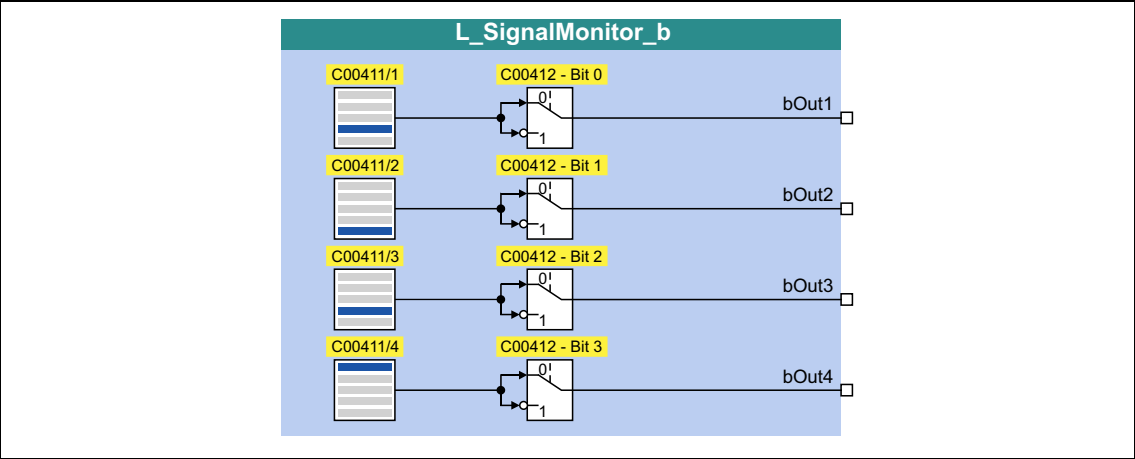

| Parameters   | Possible settings                                   | Information   |
|--|---|---|
| <a href="#">C00410/1</a><br>...<br><a href="#">C00410/4</a>  | See <a href="#">selection list - analog signals</a> | Selection of the signal sources for <i>nOut1_a</i> ... <i>nOut4_a</i> |
| <a href="#">C00413/1</a><br><a href="#">C00413/3</a><br><a href="#">C00413/5</a><br><a href="#">C00413/7</a> | -199.99      %      +199.99                         | Offset  |
| <a href="#">C00413/2</a><br><a href="#">C00413/4</a><br><a href="#">C00413/6</a><br><a href="#">C00413/8</a> | -199.99      %      +199.99                         | Gain  |

19.1.160 L\_SignalMonitor\_b

This FB outputs four binary signals which can be selected from a list of binary output signals of all function blocks provided in the device.

- Inversion of the output signals can be set.

outputs

| Designator            | Data type | Value/meaning                 |
|-----------------------|-----------|-------------------------------|
| bOut1<br>...<br>bOut4 | BOOL      | Output signal<br>FALSE / TRUE |

Parameters

| Parameters  | Possible settings   | Information   |                |       |                |       |                |       |                |       |          |       |          |       |          |       |          |  |

19.1.161 L\_SignalSwitch\_1

This FB switches between two input signals of the "WORD" data type. The switch-over is controlled by means of a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                        |
|------------|-----------|--|
| wIn1       | WORD      | Input signal 1                                       |
| wIn2       | WORD      | Input signal 2                                       |
| bSet       | BOOL      | Selection of the input signal for the output at wOut |
|            |           | FALSE wIn1   |
|            |           | TRUE wIn2  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| wOut       | WORD      | Output signal |

19.1.162 L\_SignalSwitch\_2

This FB switches between two input signals of the "WORD" data type. The switch-over is controlled by means of a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                        |
|------------|-----------|--|
| wIn1       | WORD      | Input signal 1                                       |
| wIn2       | WORD      | Input signal 2                                       |
| bSet       | BOOL      | Selection of the input signal for the output at wOut |
|            |           | FALSE wIn1   |
|            |           | TRUE wIn2  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| wOut       | WORD      | Output signal |

19.1.163 L\_SignalSwitch\_3

This FB switches between two input signals of the "WORD" data type. The switch-over is controlled by means of a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                        |
|------------|-----------|--|
| wIn1       | WORD      | Input signal 1                                       |
| wIn2       | WORD      | Input signal 2                                       |
| bSet       | BOOL      | Selection of the input signal for the output at wOut |
|            |           | FALSE wIn1   |
|            |           | TRUE wIn2  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| wOut       | WORD      | Output signal |

19.1.164 L\_SignalSwitch\_4

This FB switches between two input signals of the "WORD" data type. The switch-over is controlled by means of a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                        |
|------------|-----------|--|
| wIn1       | WORD      | Input signal 1                                       |
| wIn2       | WORD      | Input signal 2                                       |
| bSet       | BOOL      | Selection of the input signal for the output at wOut |
|            |           | FALSE wIn1   |
|            |           | TRUE wIn2  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| wOut       | WORD      | Output signal |

19.1.165 L\_SignalSwitch32\_1

This FB switches between two input signals of the "DINT" data type. The switch-over is controlled by means of a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                                |
|------------|-----------|--|
| dnIn1      | DINT      | Input signal 1   |
| dnIn2      | DINT      | Input signal 2   |
| bSet       | BOOL      | Selection of the input signal for the output at <i>dnOut</i> |
|            |           | FALSE <i>dnIn1</i>   |
|            |           | TRUE <i>dnIn2</i>  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| dnOut      | DINT      | Output signal |

19.1.166 L\_SignalSwitch32\_2

This FB switches between two input signals of the "DINT" data type. The switch-over is controlled by means of a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                                |
|------------|-----------|--|
| dnIn1      | DINT      | Input signal 1   |
| dnIn2      | DINT      | Input signal 2   |
| bSet       | BOOL      | Selection of the input signal for the output at <i>dnOut</i> |
|            |           | FALSE <i>dnIn1</i>   |
|            |           | TRUE <i>dnIn2</i>  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| dnOut      | DINT      | Output signal |

19.1.167 L\_SignalSwitch32\_3

This FB switches between two input signals of the "DINT" data type. The switch-over is controlled by means of a boolean input signal.

inputs

| Designator | Data type | Information/possible settings                                |
|------------|-----------|--|
| dnIn1      | DINT      | Input signal 1   |
| dnIn2      | DINT      | Input signal 2   |
| bSet       | BOOL      | Selection of the input signal for the output at <i>dnOut</i> |
|            |           | FALSE <i>dnIn1</i>   |
|            |           | TRUE <i>dnIn2</i>  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| dnOut      | DINT      | Output signal |

19.1.168

L\_SQrt\_1

This FB outputs the square root of the DINT input value.

inputs

| Designator | Data type | Information/possible settings |
|------------|-----------|-------------------------------|
| dnIn_p     | DINT      | Input signal                  |

outputs

| Designator | Data type | Value/meaning |
|------------|-----------|---------------|
| dnOut_p    | DINT      | Output signal |

Function

$$\text{dnOut\_p} = \sqrt{\text{dnIn\_p}}$$

## 19.1.169 L\_SRFG\_1

This FB is a ramp function generator with S-shaped ramps for limiting the increase over time of analog signals. The S-shape of the ramps is a result of trapezoidal acceleration.

- The ramp function generator is provided with a setting function so that a value can directly be loaded into the internal ramp generator.
- The balanced acceleration/deceleration time is set in [C01040](#).
- An S-ramp time can be set in [C01041](#) for jerk-free acceleration until maximum acceleration is reached.
- At the *nDeltaOut\_a* output, the  $dy/dt$  slope of the *nOut\_a* output signal is output.

## inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| nIn_a      | INT       | Input signal  |

### Loading the ramp function generator

When *bLoad* is set to TRUE, the ramp function generator is loaded with the signal at *nSet\_a*. This value is accepted immediately and output at *nOut\_a*. There is no acceleration or deceleration via an S shape. As long as *bLoad* = TRUE, the ramp function generator remains inhibited.

### Acceleration/Deceleration time and S-ramp time

The acceleration/deceleration time and the S-ramp time for jerk-free acceleration can be set separately.

- Acceleration/Deceleration time = Time until the *nOut\_a* output value has reached the *nIn\_a* input value.
- S-ramp time = Time until the ramp function generator operates at maximum acceleration.

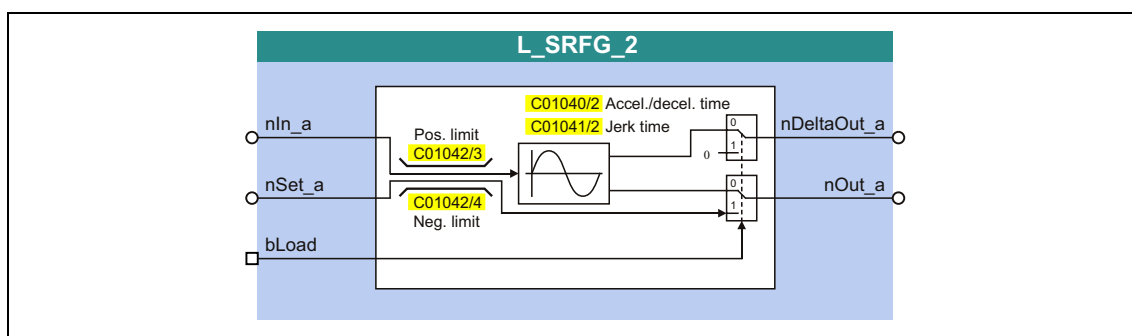

[19-75] Signal flow

## 19.1.170 L\_SRFG\_2

This FB is a ramp function generator with S-shaped ramps for limiting the increase over time of analog signals. The S-shape of the ramps is a result of trapezoidal acceleration.

- The ramp function generator is provided with a setting function so that a value can directly be loaded into the internal ramp generator.
- The balanced acceleration/deceleration time is set in [C01040](#).
- An S-ramp time can be set in [C01041](#) for jerk-free acceleration until maximum acceleration is reached.
- At the *nDeltaOut\_a* output, the  $dy/dt$  slope of the *nOut\_a* output signal is output.

## inputs

| Designator | Data type | Information/possible settings   |

For a detailed functional description see [L\\_SRFG\\_1](#).

## 19.1.171 L\_SwitchPoint\_1

This FB provides position switch points, i.e. digital switches the binary statuses (FALSE/TRUE) of which depend on the actual position.

- From version 12.00.00, eight instead of four position switch points are available.
- A position switch point serves to start peripherals as paint nozzles or knives depending on the tool position.
- Moreover the FB supports the compensation of delay times of external switching elements (dead time compensation).
- By setting a running time, position/time-based cams can be realised as well.

## inputs

| Designator         | Data type | Information/possible settings  |
|--------------------|-----------|--|
| bDisable           | BOOL      | Deactivate position switch points <ul style="list-style-type: none"> <li>This input has the highest priority.</li> </ul>   |
|                    |           | TRUE Position switch points are deactivated. <ul style="list-style-type: none"> <li>Outputs <i>bOut1</i> ... <i>bOut8</i> = FALSE</li> </ul>   |

#### 19.1.171.1 Definition of the switching range

Depending on the setting of the CenterMode ([C01064/x](#)), the switching range can be defined via a start and end position or via the data of the center point/size of switching range:

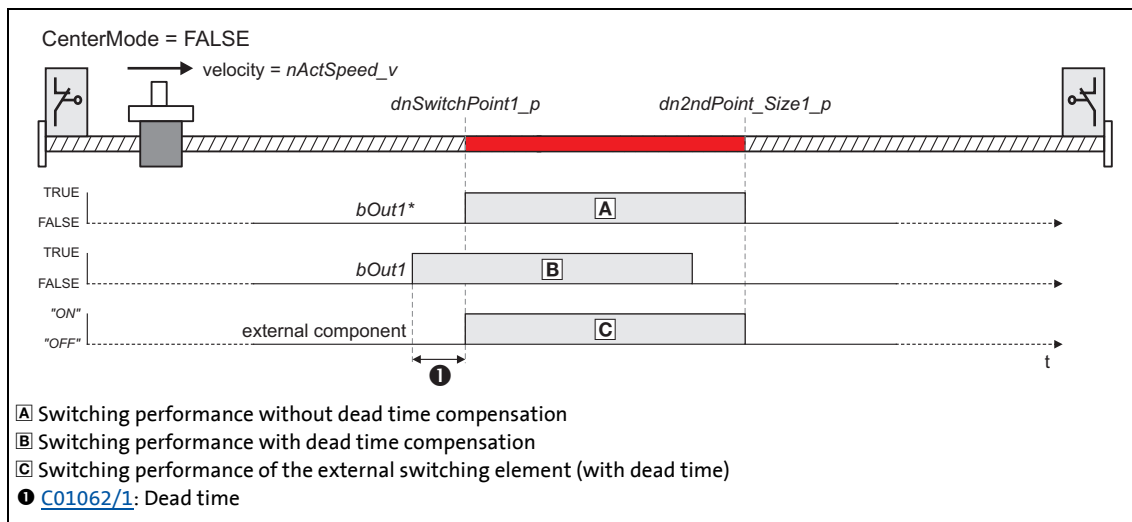

[19-76] Definition of the switching range

### 19.1.171.2 Dead time compensation

The delay time of external switching elements can be compensated by setting the corresponding delay time in [C01062/x](#). From this input and the current speed, the FB calculates a preliminary stop, i.e. the *bOut* switching output is set correspondingly earlier.

[19-77] Dead time compensation

### 19.1.171.3 Switching hysteresis

Setting a hysteresis in [C01063/x](#) serves to prevent a permanent state change of the *bOut* switching output that may be caused by actual position value changes due to a mechanical irregularity at the axis.

[19-78] Switching hysteresis

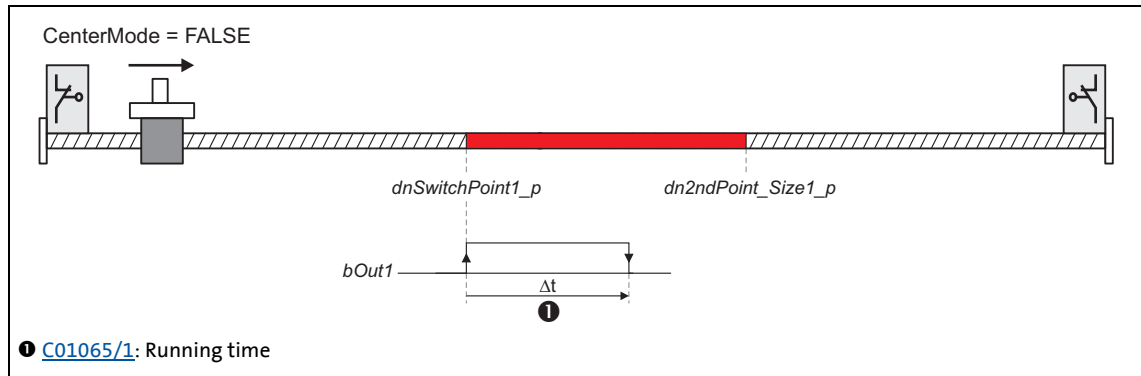

**Tip!**

Please note that a delay time set in [C01062/x](#) shifts the switching points including the hysteresis.

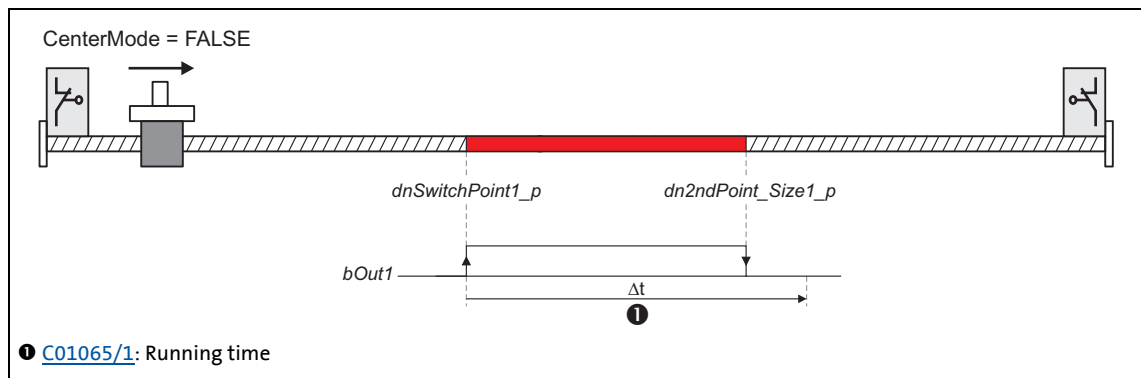

#### 19.1.171.4 Position/time-based cams

The setting of a running time in [C01065/x](#) higher 0 ms serves to realise "position/time-based cams": If the drive reaches the switching range, the *bOut* switching output is set to TRUE and reset to FALSE after the set switching time has elapsed.

[19-79] Position/time-based cams (here without switching hysteresis and dead time compensation)

If the switching range is left before the running time has expired, the *bOut* switching output is reset to FALSE:

[19-80] Position/time-based cams: Behaviour when the switching range is left before the running time has expired

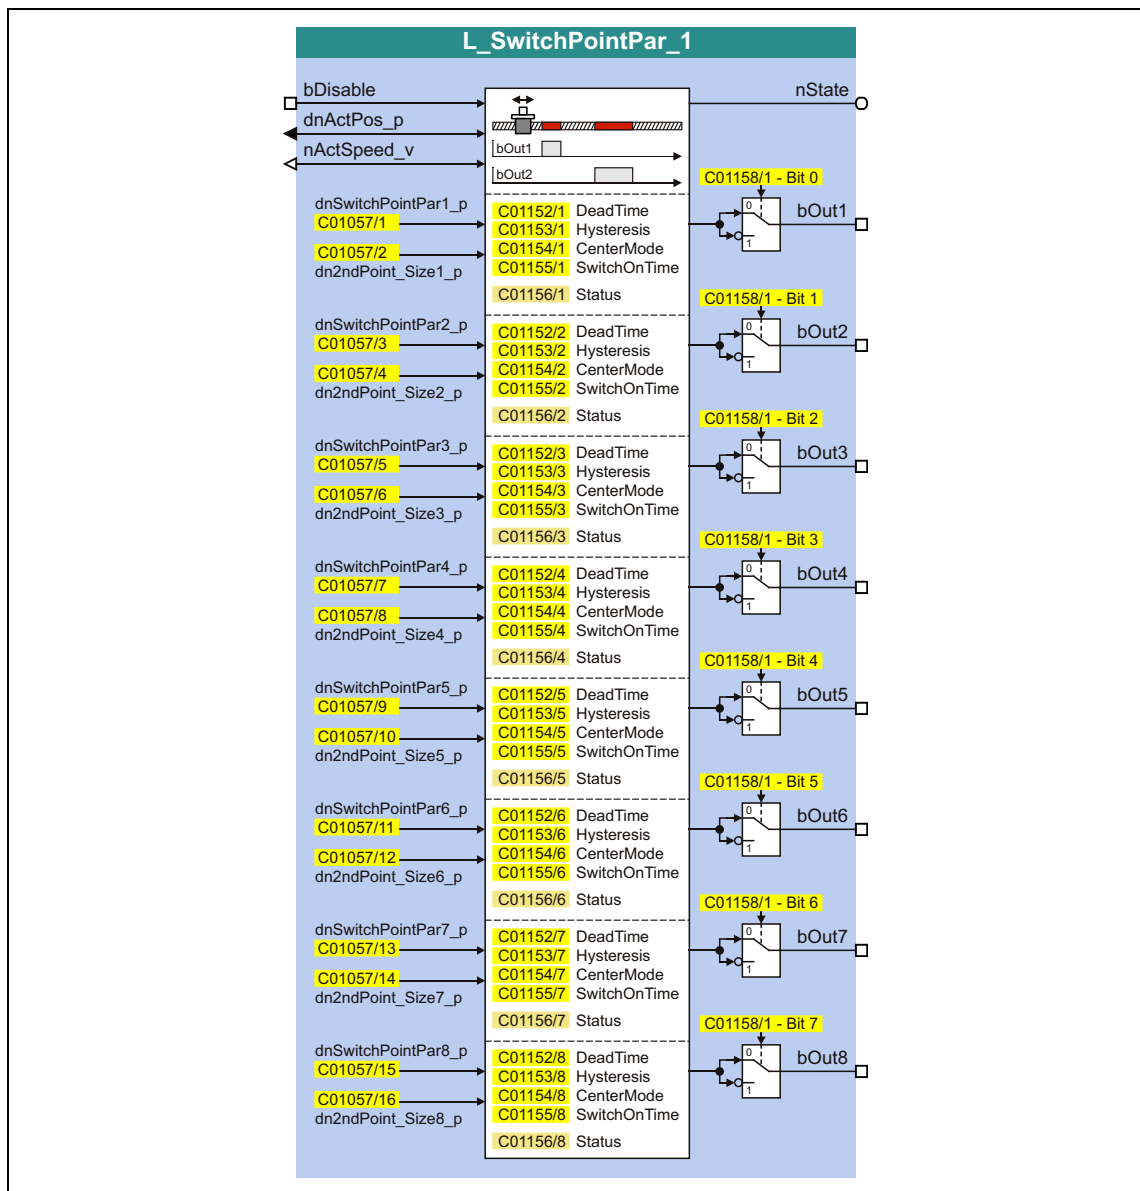

#### Tip!

Please note that for a resetting of the switching output the switching range must be left first.

## 19.1.172 L\_SwitchPointPar\_1

This FB provides position switch points, i.e. digital switches the binary statuses (FALSE/TRUE) of which depend on the actual position.

- This FB has the same function as the FB [L\\_SwitchPoint 1](#). However, for this FB the position switch point positions must be specified via parameters instead of FB inputs.
- A position switch point serves to start peripherals as paint nozzles or knives depending on the tool position.
- Moreover the FB supports the compensation of delay times of external switching elements (dead time compensation).
- By setting a running time, position/time-based cams can be realised as well.

## inputs

| Designator  | Data type | Information/possible settings  |
|-------------|-----------|--|
| bDisable    | BOOL      | Deactivate position switch points <ul style="list-style-type: none"> <li>This input has the highest priority.</li> </ul>                     |
|             |           | TRUE Position switch points are deactivated. <ul style="list-style-type: none"> <li>Outputs <i>bOut1</i> ... <i>bOut8</i> = FALSE</li> </ul> |
| dnActPos_p  | DINT      | Actual position in [increments]  |

|                          | 0                 | High edge         |        | Lenze setting                              |
|                          | 1                 | Low edge          |        |  |
|                          | 2                 | High and low edge |        |  |
| <a href="#">C01139/1</a> | 0.001             | s                 | 60.000 | Pulse duration<br>• Lenze setting: 0.001 s |

### 19.1.173.1 Function 0: Evaluate rising signal edges

[19-81] Switching performance for function selection "0: High edge"

#### Functional sequence

1. A FALSE-TRUE edge at the  $bIn$  input sets the  $bOut$  output to TRUE.
2. After the parameterised pulse duration has elapsed, the  $bOut$  output is reset to FALSE unless another FALSE/TRUE edge has been set at the  $bIn$  input.
  - If an additional FALSE-TRUE edge occurs at the  $bIn$  input, the pulse duration starts again from the beginning, i.e. the  $bOut$  output can be retriggered.

### 19.1.173.2 Function 1: Evaluate falling signal edges

[19-82] Switching performance for function selection "1: Low edge"

#### Functional sequence

1. A TRUE-FALSE edge at the  $bIn$  inputs sets the  $bOut$  output to TRUE.
2. After the parameterised pulse duration has elapsed, the  $bOut$  output is reset to FALSE unless another TRUE/FALSE edge has been set at the  $bIn$  input.
  - If an additional TRUE-FALSE edge occurs at the  $bIn$  input, the pulse duration starts again from the beginning, i.e. the  $bOut$  output can be retriggered.

### 19.1.173.3 Function 2: Evaluate rising and falling signal edges

[19-83] Switching performance for function selection "2: High and low edge"

#### Functional sequence

1. A signal change (FALSE/TRUE edge or TRUE/FALSE edge) at the *bIn* input sets the *bOut* output to TRUE.
2. After the parameterised pulse duration has elapsed, the *bOut* output is reset to FALSE unless another signal change has taken place at the *bIn* input.
  - In case of another signal change at the input *bIn*, the pulse time restarts to elapse, i.e. the output *bOut* can be retriggered.

19.1.174 L\_Transient\_2

This FB serves to evaluate digital signal edges and convert them into timed, retriggerable pulses. Rising signal edges, falling signal edges or both signal edges can be evaluated.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bIn        | BOOL      | Input for edge evaluation<br>• The function depends on the selection of edge evaluation in <a href="#">C01138/2</a> . |

outputs

| Designator | Data type | Value/meaning          |
|------------|-----------|------------------------|
| bOut       | BOOL      | Output (retriggerable) |

Parameters

| Parameters               | Possible settings |                   |        | Information                                |
|--------------------------|-------------------|-------------------|--------|--|
| <a href="#">C01138/2</a> |                   |                   |        | Function<br>• Selection of edge evaluation |
|                          | 0                 | High edge         |        | Lenze setting                              |
|                          | 1                 | Low edge          |        |  |
|                          | 2                 | High and low edge |        |  |
| <a href="#">C01139/2</a> | 0.001             | s                 | 60.000 | Pulse duration<br>• Lenze setting: 0.001 s |

For a detailed functional description see [L\\_Transient\\_1](#).

19.1.175 L\_Transient\_3

This FB serves to evaluate digital signal edges and convert them into timed, retriggerable pulses. Rising signal edges, falling signal edges or both signal edges can be evaluated.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bIn        | BOOL      | Input for edge evaluation <ul style="list-style-type: none"><li>The function depends on the selection of edge evaluation in <a href="#">C01138/3</a>.</li></ul> |

outputs

| Designator | Data type | Value/meaning          |
|------------|-----------|------------------------|
| bOut       | BOOL      | Output (retriggerable) |

Parameters

| Parameters               | Possible settings |                   |        | Information   |
|--------------------------|-------------------|-------------------|--------|---|
| <a href="#">C01138/3</a> |                   |                   |        | Function <ul style="list-style-type: none"><li>Selection of edge evaluation</li></ul> |
|                          | 0                 | High edge         |        | Lenze setting   |
|                          | 1                 | Low edge          |        |   |
|                          | 2                 | High and low edge |        |   |
| <a href="#">C01139/3</a> | 0.001             | s                 | 60.000 | Pulse duration <ul style="list-style-type: none"><li>Lenze setting: 0.001 s</li></ul> |

 For a detailed functional description see [L\\_Transient\\_1](#).

19.1.176 L\_Transient\_4

This FB serves to evaluate digital signal edges and convert them into timed, retriggerable pulses. Rising signal edges, falling signal edges or both signal edges can be evaluated.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bIn        | BOOL      | Input for edge evaluation<br>• The function depends on the selection of edge evaluation in <a href="#">C01138/4</a> . |

outputs

| Designator | Data type | Value/meaning          |
|------------|-----------|------------------------|
| bOut       | BOOL      | Output (retriggerable) |

Parameters

| Parameters               | Possible settings   | Information                                |
|--------------------------|---------------------|--|
| <a href="#">C01138/4</a> |                     | Function<br>• Selection of edge evaluation |
|                          | 0 High edge         | Lenze setting                              |
|                          | 1 Low edge          |  |
|                          | 2 High and low edge |  |
| <a href="#">C01139/4</a> | 0.001 s 60.000      | Pulse duration<br>• Lenze setting: 0.001 s |

 For a detailed functional description see [L\\_Transient\\_1](#).

19.1.177 L\_Transient\_5

This FB serves to evaluate digital signal edges and convert them into timed, retriggerable pulses. Rising signal edges, falling signal edges or both signal edges can be evaluated.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bIn        | BOOL      | Input for edge evaluation<br>• The function depends on the selection of edge evaluation in <a href="#">C01140/1</a> . |

outputs

| Designator | Data type | Value/meaning          |
|------------|-----------|------------------------|
| bOut       | BOOL      | Output (retriggerable) |

Parameters

| Parameters               | Possible settings |                   |        | Information                                |
|--------------------------|-------------------|-------------------|--------|--|
| <a href="#">C01140/1</a> |                   |                   |        | Function<br>• Selection of edge evaluation |
|                          | 0                 | High edge         |        | Lenze setting                              |
|                          | 1                 | Low edge          |        |  |
|                          | 2                 | High and low edge |        |  |
| <a href="#">C01141/1</a> | 0.001             | s                 | 60.000 | Pulse duration<br>• Lenze setting: 0.001 s |

For a detailed functional description see [L\\_Transient\\_1](#).

19.1.178 L\_Transient\_6

This FB serves to evaluate digital signal edges and convert them into timed, retriggerable pulses. Rising signal edges, falling signal edges or both signal edges can be evaluated.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bIn        | BOOL      | Input for edge evaluation<br>• The function depends on the selection of edge evaluation in <a href="#">C01140/2</a> . |

outputs

| Designator | Data type | Value/meaning          |
|------------|-----------|------------------------|
| bOut       | BOOL      | Output (retriggerable) |

Parameters

| Parameters               | Possible settings |                   |        | Information                                |
|--------------------------|-------------------|-------------------|--------|--|
| <a href="#">C01140/2</a> |                   |                   |        | Function<br>• Selection of edge evaluation |
|                          | 0                 | High edge         |        | Lenze setting                              |
|                          | 1                 | Low edge          |        |  |
|                          | 2                 | High and low edge |        |  |
| <a href="#">C01141/2</a> | 0.001             | s                 | 60.000 | Pulse duration<br>• Lenze setting: 0.001 s |

For a detailed functional description see [L\\_Transient\\_1](#).

19.1.179 L\_Transient\_7

This FB serves to evaluate digital signal edges and convert them into timed, retriggerable pulses. Rising signal edges, falling signal edges or both signal edges can be evaluated.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bIn        | BOOL      | Input for edge evaluation <ul style="list-style-type: none"><li>The function depends on the selection of edge evaluation in <a href="#">C01140/3</a>.</li></ul> |

outputs

| Designator | Data type | Value/meaning          |
|------------|-----------|------------------------|
| bOut       | BOOL      | Output (retriggerable) |

Parameters

| Parameters               | Possible settings |                   |        | Information   |
|--------------------------|-------------------|-------------------|--------|---|
| <a href="#">C01140/3</a> |                   |                   |        | Function <ul style="list-style-type: none"><li>Selection of edge evaluation</li></ul> |
|                          | 0                 | High edge         |        | Lenze setting   |
|                          | 1                 | Low edge          |        |   |
|                          | 2                 | High and low edge |        |   |
| <a href="#">C01141/3</a> | 0.001             | s                 | 60.000 | Pulse duration <ul style="list-style-type: none"><li>Lenze setting: 0.001 s</li></ul> |

 For a detailed functional description see [L\\_Transient\\_1](#).

19.1.180 L\_Transient\_8

This FB serves to evaluate digital signal edges and convert them into timed, retriggerable pulses. Rising signal edges, falling signal edges or both signal edges can be evaluated.

inputs

| Designator | Data type | Information/possible settings   |
|------------|-----------|---|
| bIn        | BOOL      | Input for edge evaluation<br>• The function depends on the selection of edge evaluation in <a href="#">C01140/4</a> . |

outputs

| Designator | Data type | Value/meaning          |
|------------|-----------|------------------------|
| bOut       | BOOL      | Output (retriggerable) |

Parameters

| Parameters               | Possible settings |                   |        | Information                                |
|--------------------------|-------------------|-------------------|--------|--|
| <a href="#">C01140/4</a> |                   |                   |        | Function<br>• Selection of edge evaluation |
|                          | 0                 | High edge         |        | Lenze setting                              |
|                          | 1                 | Low edge          |        |  |
|                          | 2                 | High and low edge |        |  |
| <a href="#">C01141/4</a> | 0.001             | s                 | 60.000 | Pulse duration<br>• Lenze setting: 0.001 s |

 For a detailed functional description see [L\\_Transient\\_1](#).

## 19.2 System blocks

This chapter describes the system blocks which are available for the inverter in the FB Editor.

The function blocks are described in the chapter "[Function blocks](#)". (1468)

### Overview of system blocks available

| System block                           | Function  | can be inserted into level: |       |
|--|---|-----------------------------|-------|
|  |   | I/O                         | Appl. |
| <a href="#">LS_AnalogInput</a>         | Interface to the analog input terminals<br>▶ <a href="#">Analog terminals</a> (425)   | ●                           |       |
| <a href="#">LS_AnalogOutput</a>        | Interface to the analog output terminals<br>▶ <a href="#">Analog terminals</a> (425)  | ●                           |       |
| <a href="#">LS_AxisBusAux</a>          | Interface to the axis bus<br>▶ <a href="#">Axis bus</a> (891)   | ●                           | ●     |
| <a href="#">LS_AxisBusIn</a>           |   | ●                           | ●     |
| <a href="#">LS_AxisBusIO</a>           |   | ●                           | ●     |
| <a href="#">LS_AxisBusOut</a>          |   | ●                           | ●     |
| <a href="#">LS_CANManagement</a>       | Control of internal functions of the CAN driver and display of the "Operational" status as well as the node address<br>▶ <a href="#">System bus "CAN on board"</a> (804)      | ●                           | ●     |
| <a href="#">LS_DataAccess</a>          | <i>Lenze internal only</i>  |                             | ●     |
| <a href="#">LS_DeviceMonitor</a>       | Motor control status signals<br>▶ <a href="#">Motor control (MCTRL)</a> (143)   |                             | ●     |
| <a href="#">LS_DFOut</a>               | Interface to the digital frequency output (multi-encoder interface X8)<br>• This SB is available from version 12.00.00.<br>▶ <a href="#">Digital frequency coupling</a> (365) | ●                           |       |
| <a href="#">LS_DigitalInput</a>        | Interface to the digital input terminals<br>▶ <a href="#">Digital input terminals</a> (401)   | ●                           |       |
| <a href="#">LS_DigitalOutput</a>       | Interface to the digital output terminals<br>▶ <a href="#">Digital output terminals</a> (422)   | ●                           |       |
| <a href="#">LS_DisFree</a>             | Display of 8 arbitrary 16-bit signals of the application on display codes   | ●                           | ●     |
| <a href="#">LS_DisFree_a</a>           | Display of 8 arbitrary analog signals of the application on display codes   | ●                           | ●     |
| <a href="#">LS_DisFree_b</a>           | Display of 16 arbitrary digital signals of the application on a bit coded display code  | ●                           | ●     |
| <a href="#">LS_DisFree_p</a>           | Display of 8 arbitrary position signals of the application on display codes   | ●                           | ●     |
| <a href="#">LS_DriveInterface</a>      | Interface to drive control (DCTRL)<br>▶ <a href="#">Device control (DCTRL)</a> (105)  |                             | ●     |
| <a href="#">LS_Keypad</a>              | Control via keypad  | ●                           |       |
| <a href="#">LS_MotionControlKernel</a> | Interface to the basic drive function implemented in the Motion Control Kernel (MCK)<br>▶ <a href="#">Basic drive functions (MCK)</a> (577)                                   |                             | ●     |
| <a href="#">LS_MotorInterface</a>      | Interface to motor control (MCTRL)<br>▶ <a href="#">Motor control (MCTRL)</a> (143)   |                             | ●     |
| <a href="#">LS_MultiEncoder</a>        | Interface to the Multi-Encoder<br>▶ <a href="#">Multi-Encoder (X8)</a> (341)  | ●                           | ●     |

| System block  | Function  | can be inserted into level: |       |
|---|---|-----------------------------|-------|
|   |   | I/O                         | Appl. |
| <a href="#">LS_ParFix</a><br><a href="#">LS_ParFix_2</a>                      | Output of frequently used constants (TRUE, FALSE, 100 %, etc.) to be used in the interconnection<br>• <a href="#">LS_ParFix_2</a> is available from version 02.00.00. | ●                           | ●     |

### 19.2.12 LS\_DigitalOutput

Interface to the digital output terminals.

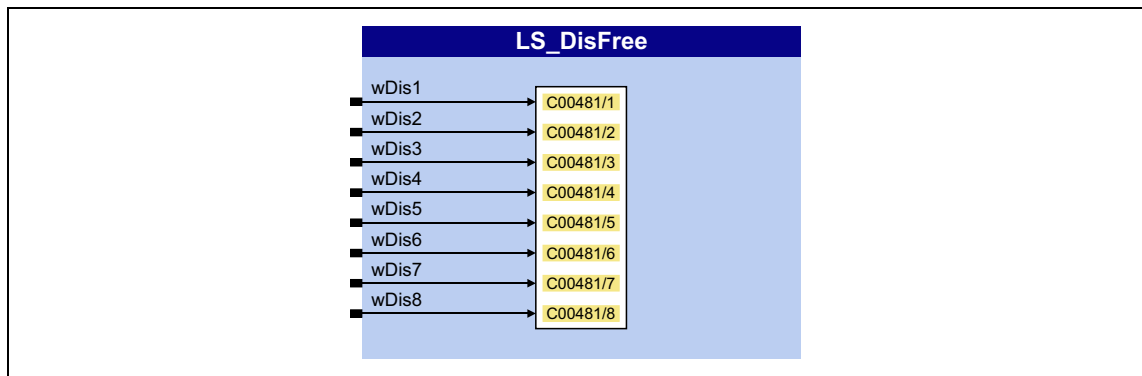

For a detailed description see the main chapter "I/O terminals":

► [Internal interfaces | System block "LS\\_DigitalOutput"](#) (📖 424)

### 19.2.13 LS\_DisFree

This system block displays 8 arbitrary 16-bit signals of the application on display codes.

#### inputs

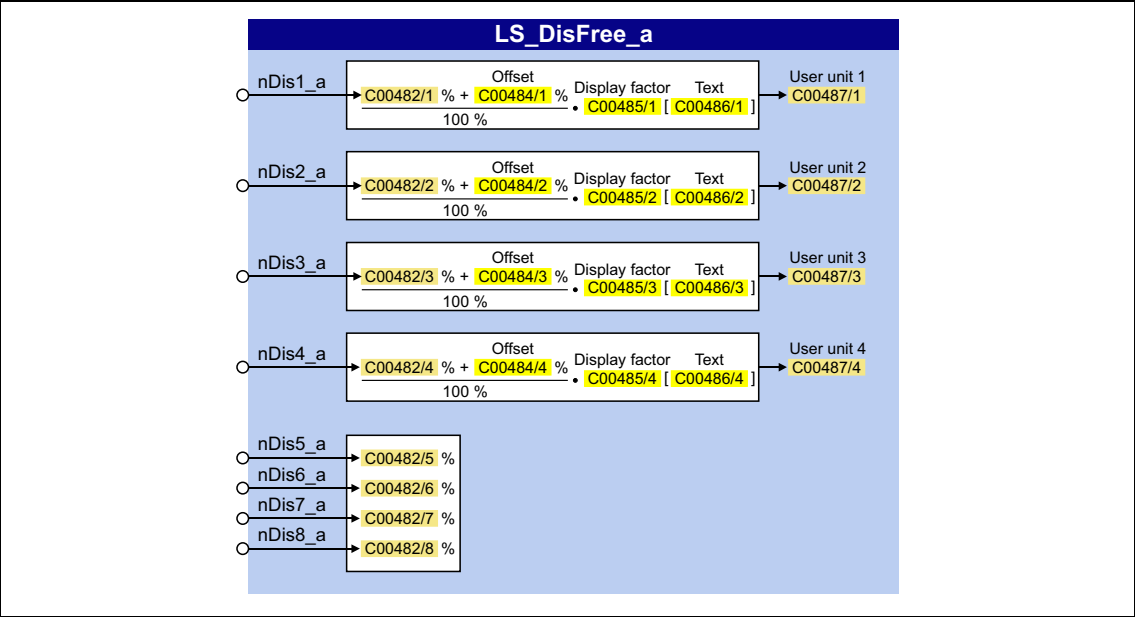

| Designator  | Information/possible settings  |
|---|--|
| Data type<br>wDis1 ... wDis8<br>WORD<br>From version 02.00.00:<br>wC481_1 ... wC481_8_a | Inputs for any 16-bit signals of the application<br><br><b>Note:</b> From version 02.00.00 the inputs are named according to the display parameter for an easier allocation. |

#### Parameters

| Parameters                   | Possible settings | Information   |
|------------------------------|-------------------|---|
| <a href="#">C00481/1...8</a> | 0x0000            | 0xFFFF  |
|                              |                   | Display of the 16-bit signals which are applied at the wDis1 ... wDis8 inputs |

19.2.14 LS\_DisFree\_a

This system block displays 8 arbitrary analog signals of the application on display codes.

inputs

| Designator   | Information/possible settings  |
|--|--|
| <div>nDis1_a ... nDis8_a</div> <div>From version 02.00.00:</div> <div>nC482_1_a ... nC482_8_a</div> <div>INT</div> | Inputs for arbitrary analog signals of the application<br><br><b>Note:</b> From version 02.00.00 the inputs are named according to the display parameter for an easier allocation. |

Parameters

| Parameters  | Possible settings  | Information   |
|---|--|---|
| <a href="#">C00482/1...8</a>  | -199.99      %      199.99   | Display of the analog signals which are applied at the nDis1_a ... nDis8_a inputs |
| <a href="#">C00484/1...4</a><br>...<br><a href="#">C00487/1...4</a> | ► <a href="#">Display of internal process factors in application units</a> |   |

### 19.2.14.1 Display of internal process factors in application units

In addition to the display in percent in [C00482/1...8](#), for the first four analog signals  $nDis1\_a$  ...  $nDis4\_a$  the configurable display parameters [C00487/1...4](#) are provided. Via these display parameters, internal process variables can be displayed, e.g. on the keypad, with an individual scaling and an individual unit (from keypad version 02.01).

**Configuration of the display parameters ([C00487/1...4](#)):**

| Parameters                   | Possible settings         |   |            | Information  |
|------------------------------|---------------------------|---|------------|--|
| <a href="#">C00484/1...4</a> | -199.99                   | % | 199.99     | Offset 1 ... 4<br>• See formula <a href="#">[19-84]</a> .<br>• Lenze setting: 0.00 %   |
| <a href="#">C00485/1...4</a> | -65536.0000               |   | 65536.0000 | Display factor 1 ... 4<br>• Scaling of the input variable for the display.<br>• See formula <a href="#">[19-84]</a> .<br>• Lenze setting: 1.0000 |
| <a href="#">C00486/1...4</a> | String<br>(max. 7 digits) |   |            | Text 1 ... 4<br>• For each display value, an individual unit (e.g. "parts") can be set.  |

$$\text{User unit 1} = \frac{nDis1\_a [\%] + \text{Offset 1} [\%]}{100 [\%]} \cdot \text{Display factor 1 [text 1]}$$

[19-84] Formula for scaling the display

#### Example 1:

- Input variable  $nDis1\_a$  = 100 %
- Offset 1 ([C00484/1](#)) = 0 %
- Display factor 1 ([C00485/1](#)) = 123.45
- Text 1 ([C00486/1](#)) = "parts"

$$\text{User unit 1} = \frac{100 [\%] + 0 [\%]}{100 [\%]} \cdot 123.45 [\text{parts}] = 123.45 \text{ parts}$$

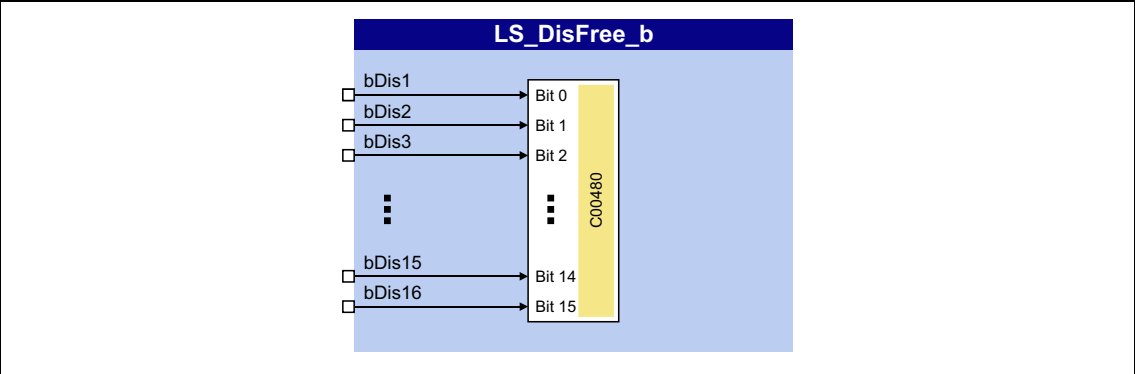

#### Example 2:

- Input variable  $nDis2\_a$  = 40 %
- Offset 2 ([C00484/2](#)) = 35 %
- Display factor 2 ([C00485/2](#)) = 20
- Text 2 ([C00486/2](#)) = "kg"

$$\text{User unit 2} = \frac{40 [\%] + 35 [\%]}{100 [\%]} \cdot 20 [\text{kg}] = 15.00 \text{ kg}$$

19.2.15 LS\_DisFree\_b

This system block displays 16 arbitrary digital signals of the application on a bit coded display code.

inputs

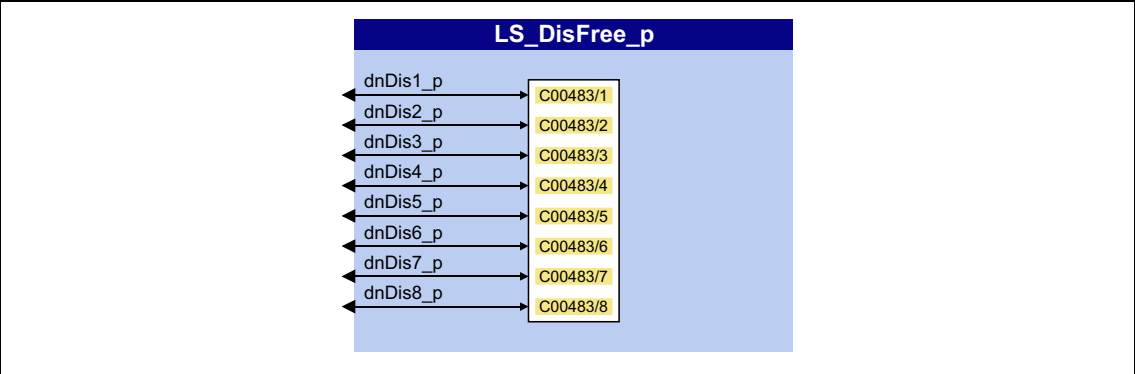

| Designator                                       | Data type | Information/possible settings  |
|--|-----------|--|
| bDis1 ... bDis16                                 | BOOL      | Inputs for arbitrary digital signals of the application  |
| From version 02.00.00:<br>bC480_B0 ... bC480_B16 |           | <b>Note:</b> From version 02.00.00 the inputs are named according to the display parameter for an easier allocation. |

Parameters

| Parameters             | Possible settings | Information   |
|------------------------|-------------------|---|
| <a href="#">C00480</a> | 0x0000            | Display of the digital signals as hexadecimal values which are applied at the <i>bDis1</i> ... <i>bDis16</i> inputs |
|                        | Bit 0             |   |
|                        | Bit 1             |   |
|                        | Bit 2             |   |
|                        | ...               |   |
|                        | Bit 15            |   |

19.2.16 LS\_DisFree\_p

This system block displays 8 arbitrary position signals of the application on display codes.

inputs

| Designator  | Data type | Information/possible settings  |
|---|-----------|--|
| dnDis1_p ... dnDis8_p                               | DINT      | Inputs for arbitrary position signals of the application   |
| From version 02.00.00:<br>dnC483_1_p ... dnC483_8_p |           | <b>Note:</b> From version 02.00.00 the inputs are named according to the display parameter for an easier allocation. |

Parameters

| Parameters                   | Possible settings |       |            | Information  |
|------------------------------|-------------------|-------|------------|--|
| <a href="#">C00483/1...8</a> | -2147483647       | Incr. | 2147483647 | Display of the position signals which are applied at the <i>dnDis1_p ... dnDis8_p</i> inputs |

19.2.17 LS\_DriveInterface

Interface to internal device control.

For a detailed description see main chapter "Device control (DCTRL)":

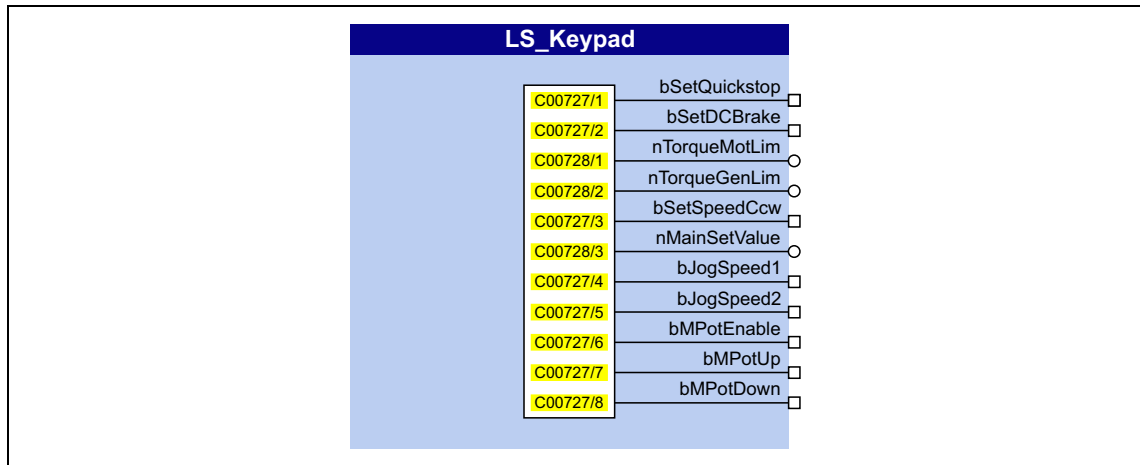

► [Internal interfaces | "LS\\_DriveInterface" system block](#)  135

### 19.2.18 LS\_Keypad

This system block is used on I/O interconnection level if the "Keypad" control mode has been selected in [C00007](#).

In the "Keypad" control mode, the **LS\_Keypad** system block passes on various setpoints and control commands to the technology application which can be selected/activated via codes using the keypad.

#### outputs

| Designator    | Data type | Value/meaning   |
|---------------|-----------|---|
| bSetQuickstop | BOOL      | <a href="#">C00727/1</a> = "1" ≡ Request quick stop   |
| bSetDCBrake   | BOOL      | <a href="#">C00727/2</a> = "1" ≡ Request DC-injection braking                               |
| nTorqueMotLim | INT       | Torque limit in motor mode set in <a href="#">C00728/1</a><br>• Lenze setting: 100.00 %     |
| nTorqueGenLim | INT       | Torque limit in generator mode set in <a href="#">C00728/2</a><br>• Lenze setting: 100.00 % |
| bSetSpeedCcw  | BOOL      | <a href="#">C00727/3</a> = "1" ≡ Request reversal   |
| nMainSetValue | INT       | Setpoint speed set in <a href="#">C00728/3</a><br>• Lenze setting: 0.00 %                   |
| bJogSpeed1    | BOOL      | <a href="#">C00727/4</a> = "1" ≡ Request fixed speed setpoint 1                             |
| bJogSpeed2    | BOOL      | <a href="#">C00727/5</a> = "1" ≡ Request fixed speed setpoint 2                             |
| bMPotEnable   | BOOL      | <a href="#">C00727/6</a> = "1" ≡ Motor potentiometer: Request activation                    |
| bMPotUp       | BOOL      | <a href="#">C00727/7</a> = "1" ≡ Motor potentiometer: Request positive acceleration         |
| bMPotDown     | BOOL      | <a href="#">C00727/8</a> = "1" ≡ Motor potentiometer: Request negative acceleration         |

## Parameters

| Parameters                   | Possible settings |   |        | Information  |
|------------------------------|-------------------|---|--------|--|
| <a href="#">C00727/1...8</a> | 0                 |   | 1      | Keypad digital values <ul style="list-style-type: none"> <li>• Execution of control commands for keypad operation</li> <li>• See the "Outputs" table for the meaning of the individual subcodes</li> </ul>       |
| <a href="#">C00728/1...3</a> | -199.99           | % | 199.99 | Analog values - keypad <ul style="list-style-type: none"> <li>• Selection of various setpoints for operation via keypad</li> <li>• See the "Outputs" table for the meaning of the individual subcodes</li> </ul> |

## 19.2.19 LS\_MotionControlKernel

Interface to the basic drive functions implemented in **Motion Control Kernel (MCK)**.

For a detailed description see the main chapter "Basic drive functions":

► [Internal interfaces | System block "LS\\_MotionControlKernel"](#) (📖 579)

## 19.2.20 LS\_MotorInterface

Interface to internal motor control.

For a detailed description see the main chapter "Motor control (MCTRL)":

► [Internal interfaces | System block "LS\\_MotorInterface"](#) (📖 321)

## 19.2.21 LS\_MultiEncoder

Interface to the Multi-Encoder.

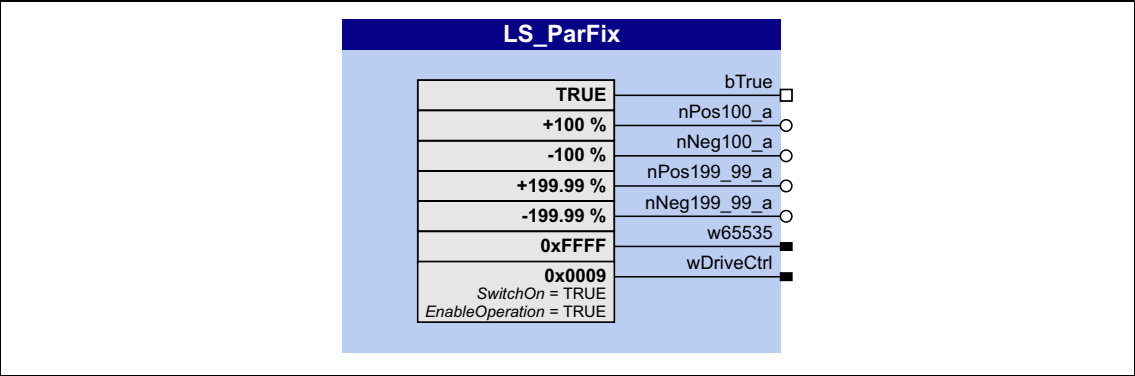

For detailed information please see the main chapter "Encoder/Feedback system":

► [Internal interfaces | "LS\\_MultiEncoder" system block](#) (📖 369)

19.2.22 LS\_ParFix

This system block outputs various fixed values (constants) to be used in the interconnection.

- From version 02.00.00, another LS\_ParFix\_2 system block is available which can be used e.g. in the application level.

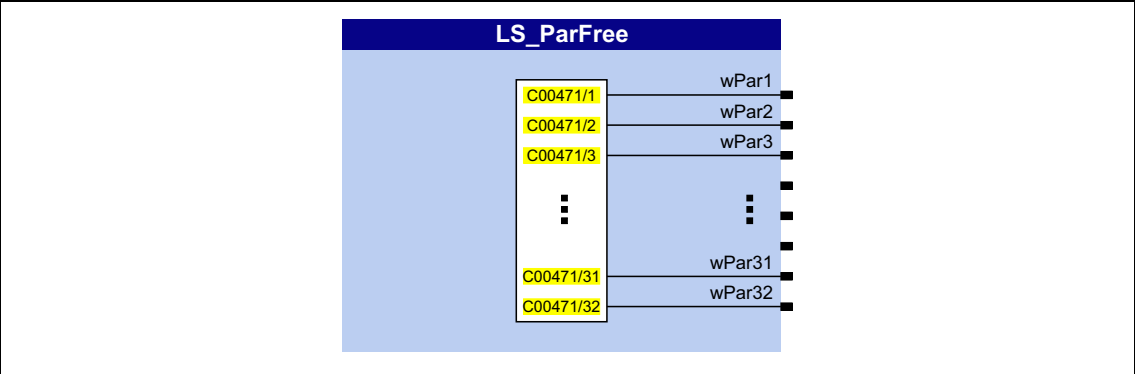

outputs

| Designator   | Data type | Value/meaning  |
|--------------|-----------|--|
| bTrue        | BOOL      | 1 ≡ TRUE   |
| nPos100_a    | INT       | 16384 ≡ + 100 %  |
| nNeg100_a    | INT       | -16384 ≡ - 100 %   |
| nPos199_99_a | INT       | 32767 ≡ + 199.99 %   |
| nNeg199_99_a | INT       | -32767 ≡ - 199.99 %  |
| w65535       | WORD      | 65535 ≡ 0xFFFF   |
| wDriveCtrl   | WORD      | 9 ≡ 0x0009 <ul style="list-style-type: none"><li>• Bit 0, SwitchOn = TRUE</li><li>• Bit 3, EnableOperation = TRUE</li><li>• All others: FALSE</li></ul> See also:<br><a href="#">wCANControl/wMCIControl control words</a> (138) |

19.2.23 LS\_ParFree

This system block outputs 32 parameterisable 16-bit signals.

outputs

| Designator                                     | Data type | Value/meaning  |
|--|-----------|--|
| wPar1 ... wPar32                               | WORD      | Output of the 16-bit signals parameterised in <a href="#">C00471/1...32</a>  |
| From version 02.00.00:<br>wC471_1 ... wC471_32 |           | <b>Note:</b> From version 02.00.00 the outputs are named according to the respective setting parameter for an easier allocation. |

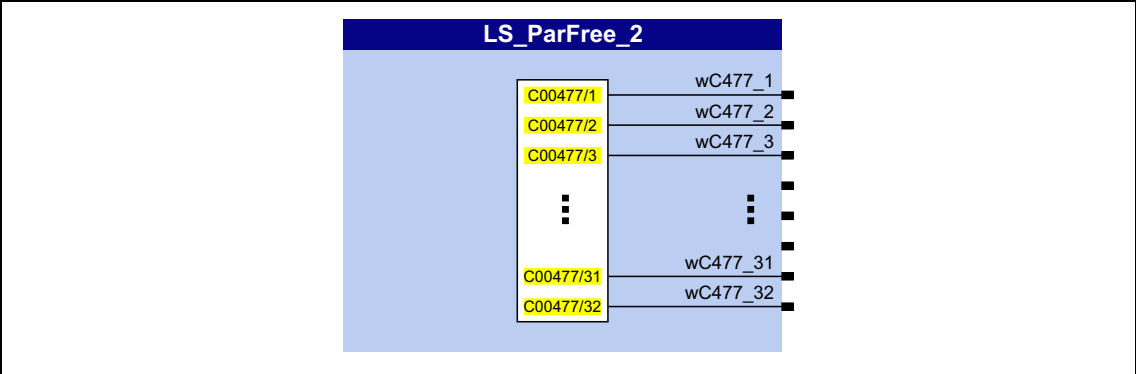

Parameters

| Parameters                    | Possible settings | Information                                |
|-------------------------------|-------------------|--|
| <a href="#">C00471/1...32</a> | 0x0000            | 0xFFFF                                     |
|                               |                   | Setting of the 16-bit signals to be output |

19.2.24

LS\_ParFree\_2

This system block outputs 32 parameterisable 16-bit signals.

outputs

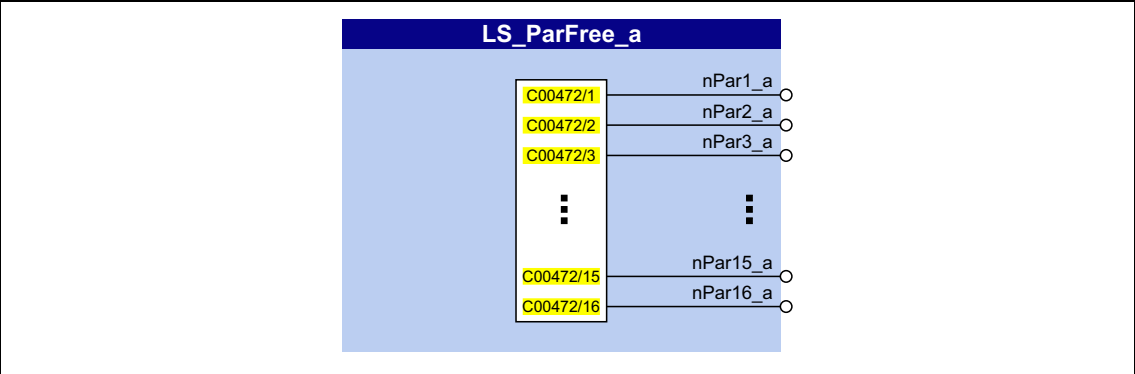

| Designator           | Data type | Value/meaning   |
|----------------------|-----------|---|
| wC477_1 ... wC477_32 | WORD      | Output of the 16-bit signals parameterised in <a href="#">C00477/1...32</a> |

Parameters

| Parameters                    | Possible settings |  |        | Information                                |
|-------------------------------|-------------------|--|--------|--|
| <a href="#">C00477/1...32</a> | 0x0000            |  | 0xFFFF | Setting of the 16-bit signals to be output |

19.2.25 LS\_ParFree\_a

This system block outputs 16 parameterisable analog signals.

outputs

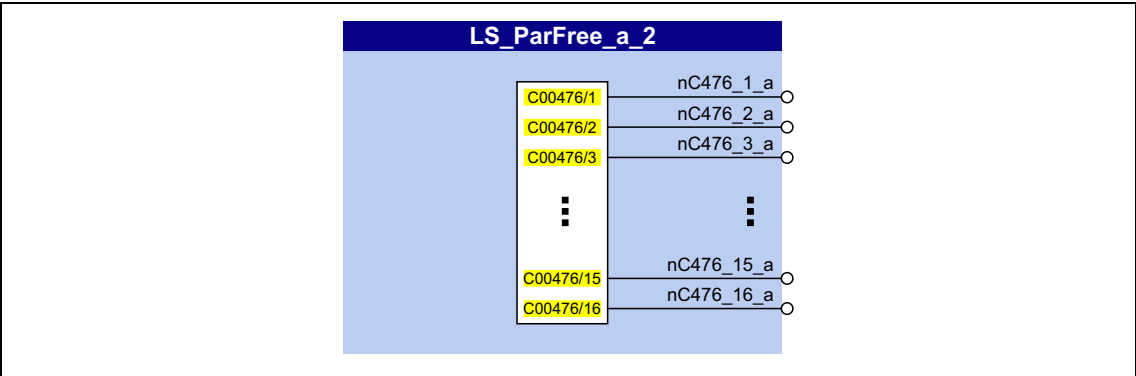

| Designator   | Data type | Value/meaning  |
|--|-----------|--|
| nPar1_a ... nPar16_a                               | INT       | Output of the analog signals parameterised in <a href="#">C00472/1...16</a>  |
| From version 02.00.00:<br>nC472_1_a ... nC472_16_a |           | <b>Note:</b> From version 02.00.00 the outputs are named according to the respective setting parameter for an easier allocation. |

Parameters

| Parameters                    | Possible settings |   |         | Information                              |
|-------------------------------|-------------------|---|---------|--|
| <a href="#">C00472/1...16</a> | -199.99           | % | +199.99 | Selection of analog signals to be output |

19.2.26 LS\_ParFree\_a\_2

This system block outputs 16 parameterisable analog signals.

outputs

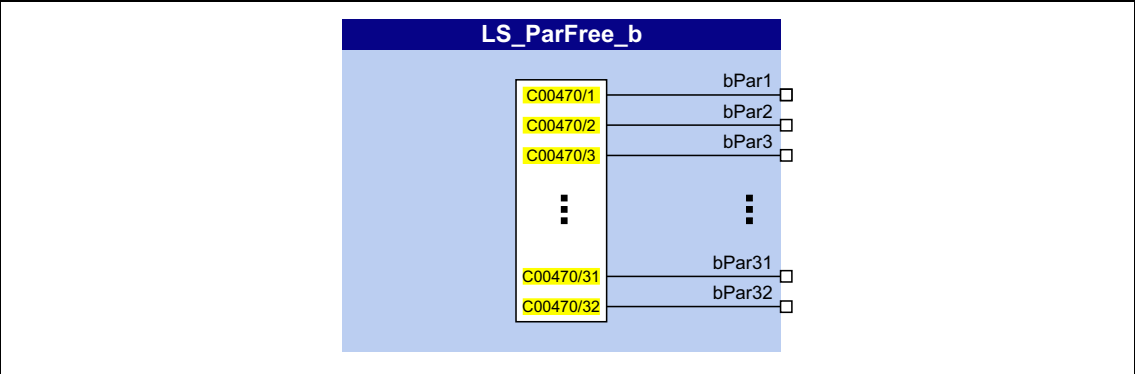

| Designator               | Data type | Value/meaning   |
|--------------------------|-----------|---|
| nC476_1_a ... nC476_16_a | INT       | Output of the analog signals parameterised in <a href="#">C00476/1...16</a> |

Parameters

| Parameters                    | Possible settings |   |         | Information                              |
|-------------------------------|-------------------|---|---------|--|
| <a href="#">C00476/1...16</a> | -199.99           | % | +199.99 | Selection of analog signals to be output |

19.2.27 LS\_ParFree\_b

This system block outputs 32 parameterisable digital signals.

outputs

| Designator                                     | Data type | Value/meaning  |
|--|-----------|--|
| bPar1 ... bPar32                               | BOOL      | Output of the signal levels (FALSE/TRUE) parameterised in <a href="#">C00470/1...32</a>  |
| From version 02.00.00:<br>bC470_1 ... bC470_32 |           | <b>Note:</b> From version 02.00.00 the outputs are named according to the respective setting parameter for an easier allocation. |

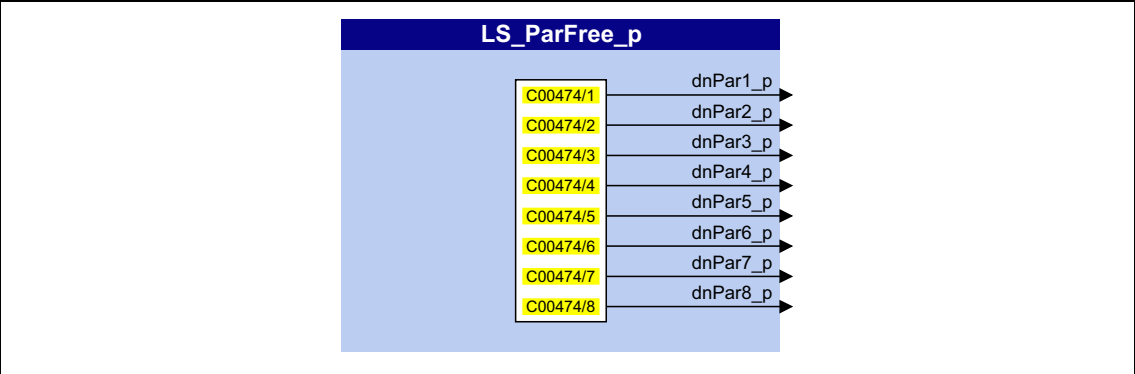

Parameters

| Parameters                    | Possible settings          | Information  |
|-------------------------------|----------------------------|--|
| <a href="#">C00470/1...32</a> |                            | Selection of signal levels to be output<br>• Bit 0 ... 31 = <i>bPar1</i> ... <i>bPar32</i> |
|                               | 0 "FALSE" signal is output |  |
|                               | 1 "TRUE" signal is output  |  |

19.2.28 LS\_ParFree\_p

This system block outputs 8 parameterisable position signals.

outputs

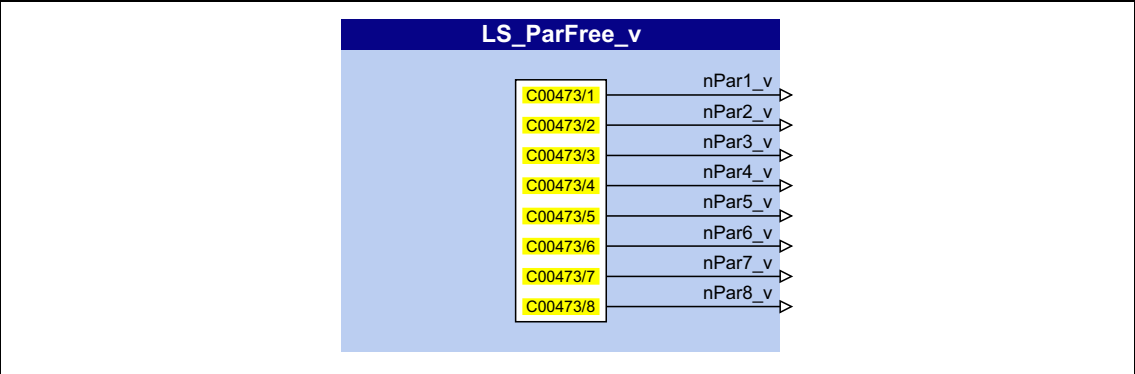

| Designator  | Data type | Value/meaning  |
|---|-----------|--|
| dnPar1_p ... dnPar8_p                               | DINT      | Output of the position signals parameterised in <a href="#">C00474/1...8</a>   |

## 19.2.34 LS\_ParReadWrite\_1-6

The **LS\_ParReadWrite\_1 ... LS\_ParReadWrite\_6** system blocks are used for reading and writing local parameters.

The system blocks support one-time and cyclic reading/writing in an adjustable time interval.

**Note!**

The main program, which also contains the parameter communication, runs as a background process with a processing time that can last from several milliseconds to several 100 milliseconds. The outputs *bDone* and *bFail* of the program organisation unit **LS\_ParReadWrite** can be used to receive the exact status of the parameter communication.

**inputs**

| Designator           | Data type | Information/possible settings  |
|----------------------|-----------|--|
| bExecute             | BOOL      | Trip read/write request  |
|                      |           | FALSE → TRUE<br>If cycle time (C01091) = "0 ms":<br><u>One-time</u> reading/writing of the parameter value which has been addressed via the <i>wParIndex</i> and <i>wParSubindex</i> inputs. |
|                      |           | TRUE → FALSE<br>If cycle time (C01091) > "0 ms":<br><u>Cyclic</u> reading/writing of the parameter value which has been addressed via the <i>wParIndex</i> and <i>wParSubindex</i> inputs.   |
| bReadWrite           | BOOL      | Deactivate cyclic reading/writing again.   |
|                      |           | TRUE → FALSE   |
|                      |           | FALSE → TRUE   |
| wParIndex            | WORD      | Selection: Read or write request   |
|                      |           | FALSE<br>Read request  |
|                      |           | TRUE<br>Write request  |
| wParSubindex         | WORD      | Code to be read or written.<br>• The selection can be made alternatively via C01090.   |
| wInHWord<br>wInLWord | WORD      | Subcode to be read or written.<br>• The selection can be made alternatively via C01090.  |
|                      |           | Value to be written (DataHigh/DataLow portion)   |

## outputs

| Designator             | Data type | Value/meaning   |
|------------------------|-----------|---|
| bDone                  | BOOL      | "Read/Write request successfully completed" status signal <ul style="list-style-type: none"> <li>The output is automatically reset to FALSE if a new request is activated via <i>bExecute</i> or the cycle time (C01091) expires.</li> </ul>                          |
|                        |           | TRUE Read/Write request successfully completed.   |
|                        |           | FALSE The FALSE status can have the following meanings: <ol style="list-style-type: none"> <li>There is no active read/write request.</li> <li>The read/write request has not been completed yet.</li> <li>An error has occurred (if <i>bFail</i> = TRUE).</li> </ol> |
| bFail                  | BOOL      | "Error" status  |
|                        |           | TRUE An error has occurred (group signal). <ul style="list-style-type: none"> <li>See display parameter (C01092) for details.</li> </ul>  |
| wOutHWord<br>wOutLWord | WORD      | Value which was read (DataHigh/DataLow portion) after read request  |

## Parameters

### 19.2.34.1 Arithmetic function

The implemented arithmetic function enables easy arithmetic conversion of the process values to be written or read via parameterisable factors into the format of the target parameter without the need of an additional arithmetic function block.

- In [C01093](#), the interpretation of the *wInHWord* and *wInLWord* inputs can be set to be able to write to parameters:

| Arithmetic mode |                                  | wInHWord                                 | wInLWord                                     | Internal conversion                |
|-----------------|----------------------------------|--|--|------------------------------------|
| 0               | No arithmetic<br>(Lenze setting) | <b>INTEGER_32</b><br>(4 bytes with sign) |  | No<br>(same behaviour as before)   |
|                 |                                  | DataHigh portion                         | DataLow portion                              |                                    |
| 1               | In16Bit:<br>LW=+/-32767          | -  | <b>INTEGER_16</b><br>(2 bytes with sign)     | Yes<br>(see the following section) |
| 2               | In16Bit: HW=+/-;<br>LW=0..65535  | <b>Sign</b><br>(0 ≡ positive value)      | <b>UNSIGNED_16</b><br>(2 bytes without sign) |                                    |
| 3               | In32Bit: HW_LW= +/-2147483647    | <b>INTEGER_32</b><br>(4 bytes with sign) |  |                                    |
|                 |                                  | DataHigh portion                         | DataLow portion                              |                                    |

#### Internal conversion

If arithmetic modes 1 ... 3 are selected in [C01093](#), the input value / read parameter value is internally converted via parameterisable factors.

- Division is not remainder considered.

$$\text{parameter value to be written} = \text{Input value}_{[32]} \cdot \frac{\text{Meters}_{[16]}}{\text{Denominator}_{[16]}}$$

[C01094](#): Numerator  
[C01095](#): Denominator

[19-85] Internal conversion with write access

$$\text{Output value}_{[32]} = \text{Read parameter value} \cdot \frac{\text{Meters}_{[16]}}{\text{Denominator}_{[16]}}$$

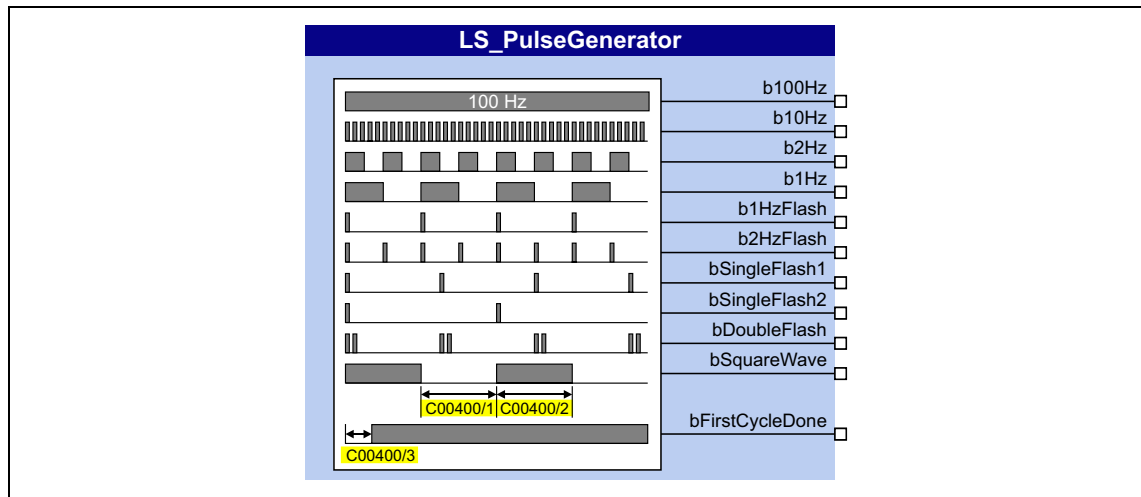

[C01094](#): Numerator  
[C01095](#): Denominator

[19-86] Internal conversion with read access

### 19.2.35 LS\_PulseGenerator

This system block outputs 9 different fixed frequencies and 1 frequency with parameterisable pulse/dead time.

The SB provides a TRUE signal at the *bFirstCycleDone* output when the first 1-ms processing cycle is completed and the time set in [C00400/3](#) has expired. This status signal can e.g. be used for the delayed enable of peripheral devices or motor control setpoints so that all required initial values are calculated first after the inverter switch-on.

#### outputs

| Designator      | Data type | Value/meaning  |
|-----------------|-----------|--|
| b100Hz          | BOOL      | Rectangular signal 100 Hz  |
| b10Hz           | BOOL      | Rectangular signal 10 Hz   |
| b2Hz            | BOOL      | Rectangular signal 2 Hz  |
| b1Hz            | BOOL      | Rectangular signal 1 Hz  |
| b1HzFlash       | BOOL      | 80 ms-pulse, repetition rate every second  |
| b2HzFlash       | BOOL      | 80 ms-pulse, repetition rate every 0.5 seconds   |
| bSingleFlash1   | BOOL      | 80 ms pulse, repetition rate every 1.25 seconds  |
| bSingleFlash2   | BOOL      | 80 ms pulse, repetition rate every 3 seconds   |
| bDoubleFlash    | BOOL      | 80 ms-double pulse, repetition rate every 1.25 seconds   |
| bSquareWave     | BOOL      | Output frequency with pulse/dead time set in <a href="#">C00400/1...2</a>  |
| bFirstCycleDone | BOOL      | Status signal "First processing cycle completed"   |
|                 | TRUE      | The first 1-ms processing cycle has been completed and the time set in <a href="#">C00400/3</a> has expired (i.e. all FBs have been called at least once). |

## Parameters

**Note!**

The real length of the low or high level at the *bSquareWave* output is always 1 ms higher than set in [C00400/1](#) or [C00400/2](#). If "0 ms" is set, a level with a length of 1 ms is created length, for instance, and if "1000 ms" is set, a level with a length of 1001 ms is created.

| Parameters               | Possible settings |    |       | Information   |
|--------------------------|-------------------|----|-------|---|
| <a href="#">C00400/1</a> | 0                 | ms | 60000 | Length of the low level (break) + 1 ms<br>• For output <i>bSquareWave</i><br>• Lenze setting: 1000 ms |
| <a href="#">C00400/2</a> | 0                 | ms | 60000 | Length of the high level + 1 ms<br>• For output <i>bSquareWave</i><br>• Lenze setting: 1000 ms        |
| <a href="#">C00400/3</a> | 0                 | ms | 60000 | Delay of the status <i>bFirstCycleDone</i><br>• Lenze setting: 100 ms                                 |

**19.2.36 LS\_Resolver**

Interface to the resolver.

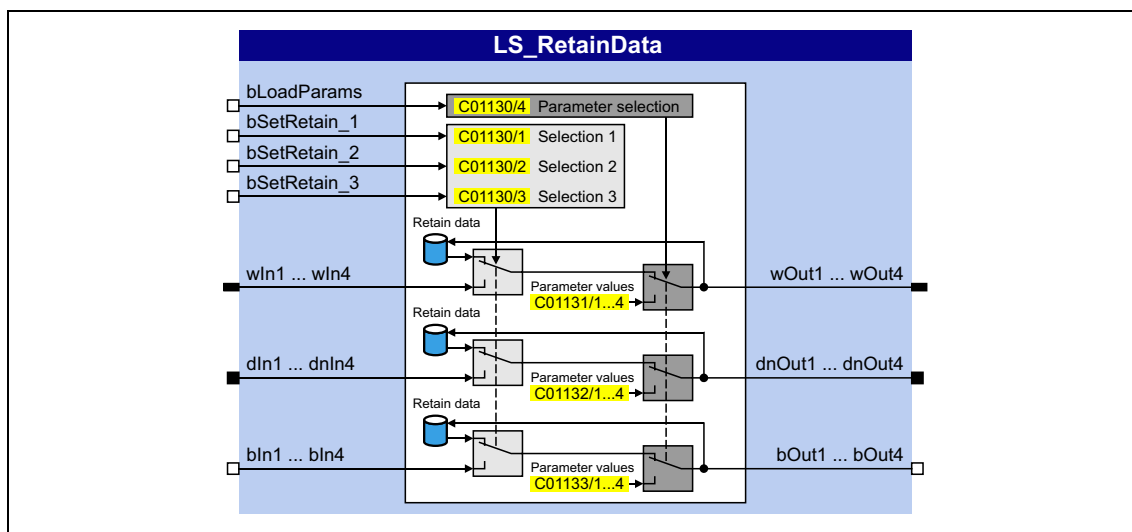

For detailed information please see the main chapter "Encoder/Feedback system":

► [Internal interfaces | "LS\\_Resolver" system block](#) (📖 340)

### 19.2.37 LS\_RetainData

This system block serves to select and save retain data similar to the FBs [L\\_SampleHold\\_1](#) and [L\\_SampleHold\\_2](#).

- Retain data are values that are saved automatically at mains disconnection or disconnection of the 24-V supply in the inverter and are restored when the 24-V supply is switched on again.
- A total of 12 retain data can be stored in the retain memory:
  - 4 WORD signals (16 bits, 0 ... 65535)
  - 4 DINT signals (32 bits, -2147483647 ... 2147483647)
  - 4 BOOL signals (FALSE or TRUE)

#### inputs

| Designator       | Data type | Information/possible settings  |
|------------------|-----------|--|
| bLoadParams      | BOOL      | Set selected outputs & retain values to parameter values. <ul style="list-style-type: none"> <li>• This input has priority over the <i>bSetRetain</i> inputs.</li> <li>• Typical application: Initialisation of the outputs &amp; retain values.</li> </ul>                      |
|                  |           | FALSE The input or retain values are output, depending on the <i>bSetRetain</i> input.   |
|                  |           | TRUE The outputs selected in <a href="#">C01130/4</a> and the respective retain values are set to the parameter values and held as long as <i>bLoadParams</i> is TRUE. If the parameter values change during this time, the respective outputs and retain values change as well. |
| bSetRetain_1...3 | BOOL      | Transfer selected input values to the retain memory ("latch")  |
|                  |           | FALSE No transfer. Retain values or parameter values (when <i>bLoadParams</i> = TRUE) are provided at the outputs.   |
|                  |           | TRUE The input values selected in <a href="#">C01130/1...3</a> are stored in the retain memory and provided at the outputs.  |
| wIn1 ... wIn4    | WORD      | Input values   |
| dnIn1 ... dnIn4  | DINT      |  |
| bIn1 ... bIn4    | BOOL      |  |

## outputs

| Designator        | Data type | Value/meaning  |
|-------------------|-----------|--|
| wOut1 ... wOut4   | WORD      | Output of the input or retain values, depending on the <i>bSetRetain</i> input |
| dnOut1 ... dnOut4 | DINT      |  |
| bOut1 ... bOut4   | BOOL      |  |

## Parameters

| Parameters                   | Possible settings     |                   |                          | Information  |
|------------------------------|-----------------------|-------------------|--------------------------|--|
| <a href="#">C01130/1...4</a> | Setting is bit coded: |                   |                          | Subcodes 1 ... 3: Selection 1 ... 3 <ul style="list-style-type: none"><li>Select which input values are to be stored in the retain memory when setting the respective <i>bSetRetain</i>-input to TRUE.</li><li>Lenze setting: 0x0000</li></ul> Subcode 4: Parameter selection <ul style="list-style-type: none"><li>Select which parameter values are to be stored in the retain memory when setting <i>bLoadParams</i> to TRUE.</li><li>Lenze setting: 0x0000</li></ul> |
|                              |                       | Subcodes 1 ... 3: | Subcode 4:               |  |
|                              | Bit 0                 | wIn1              | <a href="#">C01131/1</a> |  |
|                              | Bit 1                 | wIn2              | <a href="#">C01131/2</a> |  |
|                              | Bit 2                 | wIn3              | <a href="#">C01131/3</a> |  |
|                              | Bit 3                 | wIn4              | <a href="#">C01131/4</a> |  |
|                              | Bit 4                 | dnIn1             | <a href="#">C01132/1</a> |  |
|                              | Bit 5                 | dnIn2             | <a href="#">C01132/2</a> |  |
|                              | Bit 6                 | dnIn3             | <a href="#">C01132/3</a> |  |
|                              | Bit 7                 | dnIn4             | <a href="#">C01132/4</a> |  |
|                              | Bit 8                 | bln1              | <a href="#">C01133/1</a> |  |
|                              | Bit 9                 | bln2              | <a href="#">C01133/2</a> |  |
|                              | Bit 10                | bln3              | <a href="#">C01133/3</a> |  |

|                              | Bit 12                | Reserved          |                          |  |
|                              | Bit 13                |                   |                          |  |
| Bit 14                       |                       |                   |                          |  |
| Bit 15                       |                       |                   |                          |  |
| <a href="#">C01131/1...4</a> | 0                     |                   | 65536                    | Parameter value for retain memory (outputs <i>wOut1</i> ... <i>wOut4</i> ) <ul style="list-style-type: none"><li>Lenze setting: 0</li></ul>  |
| <a href="#">C01132/1...4</a> | -2147483647           |                   | 2147483647               | Parameter values for retain memory (outputs <i>dnOut1</i> ... <i>dnOut4</i> ) <ul style="list-style-type: none"><li>Lenze setting: 0</li></ul>   |
| <a href="#">C01133/1...4</a> |                       |                   |                          | Parameter values for retain memory (outputs <i>bOut1</i> ... <i>bOut4</i> ) <ul style="list-style-type: none"><li>Lenze setting: 0: FALSE</li></ul>  |
|                              | 0                     | FALSE             |                          |  |
|                              | 1                     | TRUE              |                          |  |

**19.2.38 LS\_SetError\_1**

Parameterisable responses to user-defined events are tripped.

For a detailed description see the main chapter "Diagnostics & error management":

▶ ["LS\\_SetError\\_1" system block](#) (📖 782)

**19.2.39 LS\_SetError\_2**

Parameterisable responses to user-defined events are tripped.

For a detailed description see the main chapter "Diagnostics & error management":

▶ ["LS\\_SetError\\_2" system block](#) (📖 783)

**19.2.40 LS\_SyncManagement**

Output of status information for synchronising the internal time base.

For a detailed description see main chapter "Synchronisation of the internal time base of the inverter":

▶ [Internal interfaces | System block "LS\\_SyncManagement"](#) (📖 913)

**19.2.41 LS\_TouchProbe**

Interface for touch probe detection.

For a detailed description see the main chapter "I/O terminals":

▶ [Touch probe detection](#) (📖 435)

**19.2.42 LS\_WriteParamList**

Writing to a configurable list which contains up to 32 local parameters.

For a detailed description see the main chapterl "[Parameter change-over](#)". (📖 914)

---

## 19.3 Application blocks

### 19.3.1 Technology application "Actuating drive speed"

This technology application serves to solve speed-controlled drive tasks, e.g. conveyor drives (interconnected), extruders, test benches, vibrators, travelling drives, presses, machining systems, metering units.

For a detailed description see [TA "Actuating drive speed"](#). (📖 454)

### 19.3.2 Technology application "actuating drive speed (AC Drive profile)"

This technology application available from version 13.00.00 provides a speed and torque control by means of "AC Drive Profile". The fieldbuses EtherNet/IP™ and system bus (CANopen) are supported.

For a detailed description see [TA "actuating drive speed \(AC Drive Profile\)"](#). (📖 481)

### 19.3.3 Technology application "Table positioning"

This technology application serves to solve position-controlled drive tasks which are normally controlled by a higher-level control via a fieldbus, e.g. transport facilities, rotary tables, storage and retrieval units, feed drives, metering units, hoists.

For a detailed description see [TA "Table positioning"](#). (📖 514)

### 19.3.4 "Switch-off positioning" technology application

This technology application is used to solve speed-controlled drive tasks which require a pre-switch off or stopping at certain positions, e.g. roller conveyors and conveying belts. The pre-switch off is implemented by connecting switch-off sensors.

For a detailed description see [TA "Switch-off positioning"](#). (📖 544)

---

## 19.4 Port blocks

### 19.4.1 Port block "LP\_CanIn1"

The **LP\_CanIn1** port block maps process data object RPDO1 in the FB Editor.

For a detailed description see [RPDO1 | Port block "LP\\_CanIn1"](#). (821)

### 19.4.2 Port block "LP\_CanIn2"

The **LP\_CanIn2** port block maps process data object RPDO2 in the FB Editor.

For a detailed description see [RPDO2 | "LP\\_CanIn2" port block](#). (823)

### 19.4.3 Port block "LP\_CanIn3"

The **LP\_CanIn3** port block maps process data object RPDO3 in the FB Editor.

For a detailed description see [RPDO3 | "LP\\_CanIn3" port block](#). (825)

### 19.4.4 Port block "LP\_CanIn4"

The **LP\_CanIn4** port block maps process data object RPDO4 in the FB Editor.

For a detailed description see [RPDO4 | "LP\\_CanIn4" port block](#). (827)

### 19.4.5 Port block "LP\_CanOut1"

The **LP\_CanOut1** port block maps process data object TPDO1 in the FB Editor.

For a detailed description see [TPDO1 | "LP\\_CanOut1" port block](#). (829)

**19.4.6 Port block "LP\_MciIn"**

The LP\_MciIn port block maps the received MCI-PDOs in the FB Editor.

For a detailed description see [Port block "LP\\_MciOut".](#) (889)

**19.4.7 Port block "LP\_MciOut"**

The LP\_MciOut port block maps the sent MCI-PDOs in the FB Editor.

For a detailed description see [Port block "LP\\_MciIn".](#) (888)

**19.4.8 Port block "LP\_CanOut2"**

The LP\_CanOut2 port block maps process data object TPDO2 in the FB Editor.

For a detailed description see [TPDO2 | "LP\\_CanOut2" port block.](#) (830)

**19.4.9 Port block "LP\_CanOut3"**

The LP\_CanOut3 port block maps process data object TPDO3 in the FB Editor.

For a detailed description see [TPDO3 | "LP\\_CanOut3" port block.](#) (831)

**19.4.10 Port block "LP\_CanOut4"**

The LP\_CanOut4 port block maps process data object TPDO4 in the FB Editor.

For a detailed description see [TPDO4 | "LP\\_CanOut4" port block.](#) (832)
